CoHyperGParams-class

Class "CoHyperGParams"

Description
A parameter class for representing all parameters needed for running the hyperGTest method with multiprotein complexes.

Objects from the Class
Objects can be created by calls of the form `new("CoHyperGParams",...).

Slots

geneIds: Object of class "ANY": A vector of gene identifiers. Numeric and character vectors are probably the only things that make sense. These are the gene ids for the selected gene set.

universeGeneIds: Object of class "ANY": A vector of gene ids in the same format as geneIds defining a subset of the gene ids on the chip that will be used as the universe for the hypergeometric calculation. If this is NULL or has length zero, then all gene ids on the chip will be used.

annotation: A string giving the name of the annotation data package for the chip used to generate the data.

categorySubsetIds: Object of class "ANY": If the test method supports it, can be used to specify a subset of category ids to include in the test instead of all possible category ids.

categoryName: A string describing the category. Usually set automatically by subclasses. For example "ScISI".

pvalueCutoff: The p-value to use as a cutoff for significance for testing methods that require it. This value will also be passed on to the result instance and used for display and counting of significant results. The default is 0.01.

testDirection: A string indicating whether the test should be for overrepresentation ("over") or underrepresentation ("under").
Methods

hyperGTest signature(p = "HyperGParams") : Perform hypergeometric tests to assess over-representation of category ids in the gene set. See the documentation for the generic function for details. This method must be called with a proper subclass of HyperGParams.

geneIds(r), geneIds(r) <- value Accessors for the gene identifiers that will be used as the selected gene list.

codeannotation(object) Accessor for annotation

ontology(r) Accessor for GO ontology.

pvalueCutoff(r), pvalueCutoff(r) <- value Accessor for the p-value cutoff. When setting, value should be a numeric value between zero and one.

testDirection Accessor for the test direction. When setting, value must be either "over" or "under".

universeGeneIds(r) accessor for vector of gene identifiers.

isConditional(r) Returns TRUE if the instance has its conditional flag set

Author(s)

S. Falcon and N. LeMeur

See Also

HyperGResult-class CoHyperGResult-class hyperGTest
**geneIds**: Object of class "ANY": the input vector of gene identifiers intersected with the universe of gene identifiers used in the computation. The class of this slot is specified as "ANY" because gene IDs may be integer or character vectors depending on the annotation package.

**testName**: A string identifying the testing method used.

**pvalueCutoff**: Numeric value used as a p-value cutoff. Used by the `show` method to count number of significant terms.

**Extends**
Class "HyperGResultBase", directly.

**Methods**

- **geneCounts** signature(r = "CoHyperGResult"): return a "numeric" vector: for each category term tested, the number of genes from the gene set that are annotated at the term.

- **pvalues** signature(r = "HyperGResult"): return a "numeric" vector: the ordered p-values for each category term tested.

- **oddsRatios** signature(r = "HyperGResult"): return a "numeric" vector: the odds ratio for each category term tested.

- **expectedCounts** signature(r = "HyperGResult"): return a "numeric" vector: the expected number of genes for each GO term tested.

- **universeCounts** signature(r = "HyperGResult"): return an "numeric" vector: for each category term tested, the number of genes from the gene universe that are annotated at the term.

- **geneIdUniverse** signature(r = "CoHyperGResult"): return a list named by the protein Complexes. Each element of the list is a vector of gene identifiers (from the gene universe) annotated at the corresponding protein complex.

- **summary** signature(r = "CoHyperGResult"): Returns a `data.frame` summarizing the test result. Optional arguments `pvalue` and `categorySize` allow specification of minimum p-value and categorySize, respectively. Optional argument `htmlLinks` is a logical value indicating whether to add HTML links (useful in conjunction with xtables print method with `type` set to "html").

DudleyPheno

List of fitness defect score generated from Dudley et al 2005

Description

Dudley et al (2005) create a collection of gene-deletion mutants to determine genes that contribute to a particular phenotype in specific environmental conditions. This list is generated from a fitness analysis under 21 different experimental conditions.

Usage

data(DudleyGenelist)
data(DudleyPhenoFull)
data(DudleyPhenoM)
data(DudleySign)

Format

DudleyGenelist is a character vector of length 814 genes. DudleyPhenoFull is a dataframe of 814 genes by 23 elements. The column contains the yeast gene name. The 22 remaining columns are the experimental conditions (see details). The values obtained in the different condition are the fitness defect scores for the 814 genes sensitive to the experimental condition, as defined by Dudley et al (2005). DudleyPhenoM is a 814 by 22 incidence matrix with rownames corresponding to the genes names and columns to an experimental condition. This matrix contains a 1 in the (i,j) position if the i-th gene is sensitive to the experimental condition of the j-th column; it contains a 0 otherwise.

Yname Yeast systematic gene name

benomyl 15ug/ml benomyl,microtubule function

CaCl2 0.7M calcium chloride, divalent cation

CAD 55uM Cadmium, heavy metal

Caff 2mg/ml Caffeine

cyclohex 0.18ug/ml cycloheximide, protein synthesis

DTT unknown
**EtOH**  YPD + 6% Ethanol

**FeLim**  iron limited, nutrient limited condition

**HU**  11.4mg/ml Hydroxyurea, DNA replication and repair

**HygroB**  50ug/ml hygromycin B, aminoglycosides

**lowPO4**  Low phosphate, nutrient limited condition

**MPA**  20ug/ml mycophenolic acid, transcriptional elongation

**NaCl**  1.2M sodium chloride, general stress condition

**Paraq**  1mM paraquat, oxidative stress

**pH3**  Low pH, general stress condition

**rap**  0.1ug/ml rapamycin, protein synthesis

**Sorb**  1.2M sorbitol, general stress condition

**UV**  100J/m2 ultra-violet, DNA replication and repair

**YPGal**  2% galactose, carbon source

**YPGly**  3% glycerol, carbon source

**YPLac**  2% lactate, carbon source

**YPRaff**  2% raffinose, carbon source

DudleySign is a list of dataframe that summaryzes in which complexes the gene related to the phenotype are found, the size of the complexes and the associated p-value. This is the result of applying a Hypergeometric test (see CoHyperGParams-class for more details) and the complexStatus function.

Dudleyresult is a data.frame that summaryzes the number of sensitive genes per condition, how many of those genes are present in the ScISI interactome and the associated p-value. This is the result of applying a Hypergeometric test (see CoHyperGParams-class for more details) and the complexStatus function.

GiaeverPheno  
List of fitness defect score generated from Giaever et al 2002

Description
Giaever et al (2002) create a collection of gene-deletion mutants to determine genes that contribute to a particular phenotype in specific environmental conditions. This list is generated from a fitness analysis under six different experimental conditions.

Usage

```r
data(GiaeverPheno)
data(GiaeverGene)
data(GiaeverExpCdt)
```

Format

GiaeverPheno is a list with 31 elements. The name of each element is a experimental condition (see details). The value of each element are the fitness defect scores for the genes sensitive to the experimental condition, as defined by Giaever et al (2002).

GiaeverGene Vector of the systematic gene names of the 5898 tested genes. Note that some updates have been made for the list to be consistent with Saccharomyces Genome Database.

GiaeverExpCdt is a 3 columns dataframe with fileID from which the data were extracted, the generation time (growth time) and the condition (media).

```
gen.   generations
rep.   replicate
ypg5a, ypg5b  yeast/peptone/galactose 5 gen. rep. a and b ==> carbohydrate source
ypg15a, ypg15b yeast/peptone/galactose 15 gen. rep. a and b ==> carbohydrate source
sorbitol5a, sorbitol5b 1.5M Sorbitol 5 gen. rep. a and b ==> sugar, osmotic stress
sorbitol20a, sorbitol15b 1.5M Sorbitol 20 and 15 gen. rep. a and b respectively ==> sugar, osmotic stress
NaCl5a, NaCl15b 1M NaCl 5 gen. rep. a and b ==> salt, osmotic stress
lysM5a, lysM5b lysine minus 5 gen. rep. a and b ==> lack of required AA
thM5a, thM15a threonine minus 5 gen. rep. a ==> lack of required AA
trpM5a, trpM15a tryptophane minus 5 gen. rep. a ==> lack of required AA
minimalPlus5a, minimalPlus5b minimal + histidine/leuvine/uracile 5 gen. rep. a and b
minimalPlus15a, minimalPlus15b minimal + histidine/leuvine/uracile 15 gen. rep. a and b
minimalC5a, minimalC5b minimal complete 5 gen. rep. a and b
nystatin5a, nystatin5b Nystatin 5 gen. rep. a and b ==> antifungal drug
nystatin15a, nystatin15b Nystatin 5 gen. rep. a and b ==> antifungal drug
pH8g5a, pH8g5b pH 8.5 gen. rep. a and b ==> alkali stress
pH8g15a, pH8g20b pH 8 15 and 20 gen. rep. a and b respectively ==> alkali stress
```
Note: in their study they confounded the 15 and 20 generations.

Giaeverresult is a data.frame that summarizes the number of sensitive genes per condition, how many of those genes are present in the ScISI interactome and the associated p-value. This is the result of applying a Hypergeometric test (see CoHyperGParams-class for more details) and the complexStatus function.

KastenmayerRaw

Data from Kastenmayer et al. 2006

Description

Kastenmayer et al. (2006) undertook the first functional studies of small open reading frames (sORFs) in any system, using the model eukaryote Saccharomyces cerevisiae. Phenotypic analyses of the new gene-deletion strains identified 22 sORFs required for haploid growth, growth at high temperature, growth in the presence of a non-fermentable carbon source, or growth in the presence of DNA damage and replication-arrest agents.

Usage

data(KastenmayerRaw)

Format

Kastenmayer is a 5 columns dataframe.

SYSTEMATIC Systematic name of the sORF.
COMMUN Commun name of the sORF.
Length Length of the small ORF sequence in number of amino acids.
Evidence Experimental source of the data
refHomology Bibliographical evidence of reported homology.
Kcollection Bibliographical evidence of reported homology.
ESSENTIAL Indicates if the sORF knockout is essential. A blank in this column indicates that the knockout is not-essential, if available.
GFPTAP "GFP" or "TAP" signifies that sORF was detected by the indicated technique. "both" indicates that sORF was detected both as a TAP-tagged and GFP-tagged protein. "None" indicates that sORF was not detected by either method. Empty field indicates that sORF was not tested.
UPTAG Sequence of the upstream primer.
DOWNTAG Sequence of the downstream primer.

LesageRaw Data from Lesage et al. 2005

Description

Lesage et al. (2005) assembled a network of 316 interactions among 163 genes using deletion mutants in CHS1, CHS3, CHS4, CHS5, CHS6, CHS7 and BNI4 in a synthetic genetic array analysis.

Usage

data(LesageRaw)

Format

LesageRaw is a 5 column dataframe.

SYSTEMATIC Systematic gene names. NOTE: All mutants are isogenic to BY4741 (MATa his3::0394 leu2::0394 met15::0394 ura3::0394) except anp1::0394 and mnn9::0394 that are isogenic to BY4742 (MAT::03b1 his3::0394 leu2::0394 lys2::0394 ura3::0394).

COMMUN Commun gene names.

CFW Mutants showing increased, decreased or wild type sensitivity to Calcofluor white are scored s, r, or wt, respectively.

ChitinLevel Chitin level (nmole GlcNAc/mg dry weight). Values are an average of at least three independent determinations. Values statistically higher and lower than wild type (p < 0.01) are highlighted in red and green, respectively.

ChitinLevel.SD Standard deviation of the average of at least three independent determinations of Chitin level.

Data from Osterberg at al. 2006

Description
Osterberg at al. (2006) report growth phenotypes in yeast for a strain collection over-expression ~600 C-terminal tagged integral membrane proteins growth both under normal and three different stress conditions.

Usage
data(OsterbergRaw)

Format
OsterbergRaw is a 17 columns dataframe.

SYSTEMATIC Systematic gene names of the studied membrane protein

COMMUN Commun gene names of the studied membrane protein

TMHMM.C The topology predicted by TMHMM (TransMembrane prediction using Hidden Markov Models) using the experimentally assigned C-terminal location for the protein as a constraint. The topology is represented in the format Location of N-terminus TMhelices Location of C-terminus (i and o stand for in and out respectively)

WesternBlot Protein expression levels (arbitrary units), estimated from the band intensity and normalized to the internal standard on each Western blot.

Bands Proteins detected as two distinct bands with different molecular mass on the Western blot analysis. category 1 indicates that both bands were insensitive to Endo H digestion, 2 indicates the higher molecular mass was shifted down upon Endo H digestion on SDS/PAGE and one band was predominant compared to the other, and 3 indicates that a higher molecular mass band shifted down upon Endo H digestion on SDS/PAGE and both bands were equal intensity on Western blot.

Toxicity Toxicity index from Spoko et al. (2006). The index varies between 1 and 5, where 1 means the strain is dead, and 5 indicates no difference in growth rate compared with the wild type strain.

sign.norm Over-expression strains that show a significant (P<0.001) growth rate phenotype (LSCrate) in synthetic defined medium conditions (Warringer et al., 2003). An average of two replicates is given. Strains that do not show a significant difference in doubling time compared with the wild-type strain are indicated by 0.

all.norm Phenotypes (significant or not) of over-expression strains (LSCrate) in synthetic defined medium conditions (Warringer et al., 2003). An average of two replicates is given.

sign.NaCl Over-expression strains that show a significant (P<0.001) growth rate phenotype (LPI-rate) in NaCl. An average of two replicates is given. Strains that do not show a significant difference in doubling time compared with the wild-type strain under NACL stress are indicated by 0.

all.NaClLSC Phenotypes (significant or not) of over-expression strains (LSCrate) in NaCl (Warringer et al., 2003). An average of two replicates is given.

all.NaClLPI Phenotypes (significant or not) of over-expression strains (LPIrate) in NaCl (Warringer et al., 2003). An average of two replicates is given.
sign.caff  Over-expression strains that show a significant (P<0.001) growth rate phenotype (LPI-rate) in caffeine. An average of two replicates is given. Strains that do not show a significant difference in doubling time compared with the wild-type strain under caffeine stress are indicated by 0.

all.caff.LSC  Phenotypes (significant or not) of over-expression strains (LSCrate) in caffeine (Warringer et al., 2003). An average of two replicates is given

all.caff.LPI  Phenotypes (significant or not) of over-expression strains (LPIrate) in caffeine (Warringer et al., 2003). An average of two replicates is given.

sign.paraq.  Over-expression strains that show a significant (P<0.001) growth rate phenotype (LPI-rate) in paraquat. An average of two replicates is given. Strains that do not show a significant difference in doubling time compared with the wild-type strain under paraquat stress are indicated by 0.

all.paraq.LSC  Phenotypes (significant or not) of overexpression strains (LSCrate) in paraquat (Warringer et al., 2003). An average of two replicates is given.

all.paraq.LPI  Phenotypes (significant or not) of overexpression strains (LPIrate) in paraquat (Warringer et al., 2003). An average of two replicates is given.

SGDphenoL

Saccharomyces Genome Database list of phenotypic data

Description

Saccharomyces Genome Database list of phenotypes and associated genes from several published experiments (last update 2006).

Usage

data(SGDphenoL)

Format

SGDphenoL is a list of phenotypes. Under each phenotype is listed the genes that potentially induce that phenotype. A binary matrix can be built from that list using the list2Matrix function from the Rintact package.

buildFDMat Build fitness defect contingency matrix

Description
Function to build a fitness defect contingency matrix where rows correspond to tested genes and columns to experimental conditions.

Usage
buildFDMat(data, genenames, condition)

Arguments
data List of 'significant' fitness defect scores and the associated genes at different experimental conditions.
condition Character vector of the different experimental conditions tested
genenames Character vector of all the tested genes for fitness defect.

Value
Contingency matrix of genes that present significant fitness defect in different experimental conditions.

Author(s)
N. LeMeur

Examples

data(GiaeverPheno)
data(GiaeverExpCdt)
data(GiaeverGene)
fitnessData <- getFDgene(GiaeverPheno, condition=GiaeverExpCdt, cutoff=c(20,100,100), mode="generation", subset=c(5,15,20))
GiaeverPhenoM <- buildFDMat(data=fitnessData, genenames=GiaeverGene, condition=GiaeverExpCdt)

categoryToEntrezBuilder

Return a list mapping multi-protein complexes IDs to YEAST ids

Description

Return a list mapping multi-protein complexes (category) IDs to the YEAST ids annotated at the category id.

Usage

```r
## S4 method for signature 'CoHyperGParams':
categoryToEntrezBuilder(p)
```

Arguments

- **p** A subclass of `HyperGParams-class`

Details

End users should not call this directly. This method gets called from `hyperGTest`. To add support for a new category, a new method for this generic must be defined. Its signature should match a subclass of `HyperGParams-class` appropriate for the new category.

Value

A list mapping category IDs to YEAST identifiers.

Author(s)

S. Falcon and N. LeMeur

See Also

`hyperGTest CoHyperGParams-class`

Examples

```r
data(ScISIC)
data(essglist)
essential <- names(essglist)

params <- new("CoHyperGParams",
geneIds=essential,
universeGeneIds=rownames(ScISIC),
annotation="org.Sc.sgd.db",
categoryName="ScISIC",
pvalueCutoff=0.01,
testDirection="over")

categoryToEntrezBuilder(params)[1:2]
```
complexStatus

Complex Status

Description

Categorize the complex whether or not a complex is composed of a significant number of genes involved in a particular phenotype than expected by chance.

Usage

complexStatus(data, phenotype, interactome, threshold=0.05)

Arguments

data Output from CoHyperG test
phenotype List of gene names inducing an observed phenotype, e.g., list of essential gene names (see package SLGI)
interactome A binary matrix composed of genes (rows) and biological complexes (columns) (see package ScISI)
threshold p value threshold (default 0.05)

Details

We form four distinct categories from A to D to characterize how a complex might be involved in a particular phenotype (according to the number of genes it contains and that are involved in a particular phenotype - see also CoHyperG function)

Value

The returned value is a list with components:

A “interesting” complexes, complexes with a significant number of interesting genes, i.e., genes that participate to a particular phenotype (at a given p-values threshold)
B complexes with a NON significant number of interesting genes BUT that SHARE genes with complexes from the A status
C complexes with a NON significant number of interesting genes AND that DON’T SHARE interesting genes with complexes from cat A
D complexes WITHOUT interesting genes, i.e. the one involved in the studied phenotype

Author(s)

N. LeMeur
Examples

data(ScISI)
data(essglist)
essential <- names(essglist)

CoparamsESS <- new("CoHyperGParams",
geneIds=essential,
universeGeneIds=rownames(ScISI),
annotation="org.Sc.sgd.db",
categoryName="ScISI",
pvalueCutoff=0.01,
testDirection="over")

sign<- hyperGTest(CoparamsESS)
test05 <-complexStatus(data=sign, phenotype=essential,
interactome=ScISI, threshold=0.05)

---

deResult-class

A class for representing the result of a densityEstimate test.

Description

A class for representing the result of a densityEstimate test.

Slots

Size: Object of class "numeric" representing the size of the cellular organizational unit tested

Observed: Return a "numeric" vector: the observed number of interactions between genes inducing a specific phenotype and each cellular organizational units

Expected: Return a matrix: the expected number of interactions between genes inducing a specific phenotype and each cellular organizational units

Extends

Class "testResult", directly.

Methods

plot Graphical representation of the test result

Author(s)

N. LeMeur

See Also

testResult, gtResult, densityEstimate.plot
Examples

```r
## apply a densityEstimate test
data(DudleyPhenoM)
data(ScISIC)

DudleyPhenoL <- apply(DudleyPhenoM, 2, function(x) names(which(x == 1)))
pH3 <- DudleyPhenoL["pH3"]

perm <- 20
pH3Density <- densityEstimate(genename = pH3, interactome = ScISIC, perm = perm)

## access results
pH3Density@Observed[1:5]

## use of the plot method
plot(pH3Density)
```

densityEstimate  

### Observed versus Expected Ratios

Description

Function to calculate the ratio of genes that characterize a phenotype (observed) among the genes that characterize a biological complex versus the ratio of a set of randomly sampled genes (expected) among the genes that characterize a biological complex.

Usage

densityEstimate(genename, interactome, perm)

Arguments

- `genename` Character vector of the gene names that characterize a specific phenotype.
- `interactome` Contingency matrix of genes (rows) and biological complexes (columns) (see package `ScISI`)
- `perm` Numeric vector indicating the number of simulations to run to compute the expected ratios.

Value

List of observed and simulated ratios.

Author(s)

N. LeMeur

Examples

```r
data(ScISI)
data(essglist)

essential <- names(essglist)
ScISI <- as.matrix(ScISI)

ratio <- densityEstimate(genename = essential, interactome = ScISI, perm = 50)
```
getDescr  

Get formatted annotation data

Description

Function to retrieve the annotation of multi-protein complexes or pathways via GO, MIPS or KEGG.

Usage

getDescr(x, database="GO.db")

Arguments

x Vector of multi-protein complexes or pathways IDs to be described
database Source of annotation. The database currently available are MIPS, GO.db and KEGG.db

Author(s)

N. LeMeur

Examples

xx <- getDescr(c("MIPS-220","MIPS-260.20","04111"),c("MIPS","KEGG.db"))

getFDgene  

Get fitness defect genes

Description

Function to select genes that present a significant growth defect according to the condition (media) or generation time.

Usage

getFDgene(data,condition,cutoff,mode="generation",subset)

Arguments

data List of fitness defect scores for genes tested at different experimental conditions.
condition Dataframe of experimental conditions
cutoff Numerical vector of length one or more, defining the threshold of ‘significance’ for the fitness defect score
mode Character string defining the base of the selection either ’condition’ (media) or ’generation’ time, Default=generation.
subset Numerical vector or list to which apply the different cutoffs.
**Value**

Reduced list of gene fitness scores per experimental condition according to the experimental condition or the generation time.

**Author(s)**

N. LeMeur

**References**

**Examples**

```r
data(GiaeverPheno)
data(GiaeverExpCdt)
## Select all the genes, in the different experimental conditions, that present a fitness score above 20, 100 and 100 at 5, 15 and 20 generations, respectively
fitnessGen <- getFDgene(GiaeverPheno, condition=GiaeverExpCdt, cutoff=c(20,100,100), mode="generation", subset=c(5,15,20))
## Select all the genes, that present a fitness score above 15 and 100 in the condition set A and B respectively, independently of the generation time
fitnessCondt <- getFDgene(GiaeverPheno, condition=GiaeverExpCdt, cutoff=c(100,15), mode="condition", subset=list(a=c(1:23,27,30,31),b=c(24:26,28,29)))
```

---

**graphTheory**

*Graph theory to test associations between two or more relationships*

**Description**

Graph theory approach associated with a permutation test to evaluate whether the number of associations is unexpectedly large.

**Usage**

```r
graphTheory(genename, interactome, perm)
```

**Arguments**

- `genename`: A vector a gene names that are associated with a particular phenotype
- `interactome`: A binary matrix composed of genes (rows) and biological complexes (columns) (see package ScISI)
- `perm`: Numeric, number of permutation run

**Details**

We form two distinct graphs where the set of nodes are the proteins (genes) in the organism. In one graph we create edges between genes if the two genes are members of one, or more, protein complexes. In the second graph we create an edge between all genes that are associated to a particular phenotype. We then construct a third graph on the same node set, but where there is an edge in this graph only if there is an edge in both of the first two graphs. We count the number of edges in the third and test by permutation whether the number of edges is unexpectedly large.
Value

The returned value is a list with components:

- **edgeCount**: Number of associations observed between the genes that are linked to a particular phenotype and the given interactome.
- **edgeSimul**: Number of associations if the genes that are linked to a particular phenotype are randomly distributed across the given interactome.
- **p.value**: Returned p.value

Author(s)

R. Gentleman and N. LeMeur

References

Examples

```r
data(ScISI)
data(essglist)
ans <- graphTheory(names(essglist), ScISI, perm=3)
```

---

**gtResult-class**

A class for representing the result of a graphTheory test.

Description

A class for representing the result of a `graphTheory` test.

Slots

- **p.value**: Object of class "numeric"
- **Observed**: Return a "numeric" vector: the observed number of interactions between genes inducing a specific phenotype and each cellular organizational units
- **Expected**: Return a matrix: the expected number of interactions between genes inducing a specific phenotype and each cellular organizational units

Extends

Class "testResult", directly.

Methods

- **plot**: Graphical representation of the test result

Author(s)

N. LeMeur
### overlap

#### Description

Count the number of proteins shared by protein complexes

#### Usage

```r
overlap(interactome)
```

#### Arguments

- `interactome` Binary matrix composed of genes (rows) and biological complexes (columns) (see package *ScISI*)

#### Value

The returned value is a data frame with components:

- `C1` Name of the first biological complex
- `C2` Name of the second biological complex
- `nbSharedProt` Number of proteins in common

#### Author(s)

N. LeMeur
plot

See Also
ScISI

Examples

xx = cbind("a"=c(0,1,1,1),"b"=c(1,1,0,1))
overlap(xx)

plot

Graphical method to represent the result of the density or graph test.

Description
a plot method for deResult and gtResult objects.

Usage

## S4 method for signature 'deResult':
plot(x,...)
## S4 method for signature 'gtResult':
plot(x,...)

Arguments

x the deResult or gtResult object to plot.
... general commands to be sent to plot.

Details

The plot generated from a deResult object is a set of density plots.
The plot generated from a gtResult object is a histogram.

Author(s)

N. LeMeur

Examples

data(ScISI)
data(essglist)
essential <- names(essglist)
ScISI <- as.matrix(ScISI)
ratio<- densityEstimate(genename=essential,interactome=ScISI,perm=50)
plot(ratio)
ppiInteract

Test the association between AP-MS data and phenotype

Description

Test the association between AP-MS data and phenotype data via a graph and permutation model.

Usage

ppiInteract(genename, expGraph, bait, prey, perm=10)

Arguments

gename Genes associated to a phenotype
expGraph A graphNEL object (a direct graph instance of class graph). The nodes are the union of viable baits (VB) and viable prey (VP) of the experiment (see package ScISI)
bait Proteins which was sampled as a bait in the binary relationship
prey Proteins which was sampled as a prey in the binary relationship
perm Number of permutation

Value

The returned value is a list:

- Observed Observed values
- Expected Expected values after each permutation

Examples

data(ScISI)
data(essglist)
s1 <- ppiInteract(names(essglist), Gavin2002BPGraph, viableBaits[[8]], viablePrey[[8]], perm=10)
reduceM  

Resize a matrix

Description
Resize a matrix to the number of rows commun to a vector.

Usage
reduceM(x, mat, threshold=0)

Arguments
x  Character or numeric vector.
mat  Matrix sharing rownames with the supplied vector x.
threshold  Threshold upon column. Only the columns with a colSums above the threshold are kept.

Value
Resized matrix.

Author(s)
N. LeMeur

Examples
mat <- matrix(c(1:25), nrow = 5, ncol = 5, dimnames = list(c(LETTERS[1:5]), c(1:5)))
xx <- LETTERS[c(2, 4, 5)]
reduceM(xx, mat)

testResult-class  A virtual class for representing the result of a test.

Description
The testResult class is the virtual base class for all result objects of the densityEstimate and graphTheory tests proposed in PCpheno.

Objects from the Class
A virtual Class: No objects may be created from it.

Slots

**Observed**: Return a "numeric" vector: the observed number of genes or interactions within each cellular organizational units

**Expected**: Return a numeric or a matrix: the expected number of genes or interactions within each cellular organizational units
truncName

Methods

No methods defined with class "testResult" in the signature.

Author(s)

N. LeMeur

See Also

gtResult, deResult

| truncName | Truncate character strings |

Description

Truncate character strings

Usage

truncName(x, n)

Arguments

x  Character string
n  Maximum length (in characters)

Value

Character string

Author(s)

N. LeMeur

Examples

xx <- "Anticonstitutionnelement is a family name"
truncName(xx, 5)
