exprModel-class

Class "exprModel": A class to represent an ExpressionSet model

Description

exprModel is a class to represent an ExpressionSet model. This class inherits from the virtual class, gModel. An object of exprModel is responsible for storing and updating the data.

Objects from the Class

Objects can be created by calls of the form `new("exprModel", ...). The initialize method for this class will be created in other packages that use this package (for example, the initialize method will be created in the iSNNetwork package).

Slots

- `modelData`: the model data, which is an ExpressionSet
- `linkData`: a list of functions that link this model to its parent and child models (if it has any)
- `virtualData`: the data that is needed by the views of this object
- `modelName`: the name of this model
- `modelVar`: a list of variables that refer to the modelData (for instance this may be t-test values that were calculated from the modelData)

Extends

Class "gModel", directly.
graphModel-class

Methods

No methods defined with class "exprModel" in the signature. The methods for this class will be created in other packages that use this package like iSNnetwork.

graphModel-class

Description

graphModel is a class to represent a graph model. This class inherits from the virtual class, gModel. An object of graphModel is responsible for storing and updating the data.

Objects from the Class

Objects can be created by calls of the form new("graphModel" , ...). The initialize method for this class will be created in other packages that use this package (for example, the initialize method will be created in the iSNnetwork package).

Slots

modelData: the model data, which is a graph object
linkData: a list of functions that link this model to its parent and child models (if it has any)
virtualData: data that is needed by views of this model
modelName: the name of this model
modelVar: a list of variables that refer to the modelData (for instance this may be t-test values that were calculated from the modelData)

Extends

Class "gModel", directly.

Methods

No methods defined with class "graphModel" in the signature. The methods for this class will be created in other packages that use this package like iSNnetwork.

Class "graphView": A class to represent a graph view

**Description**

`graphView` is a class to represent a view that is a graph. `graphView` inherits from the class, `plotView`, which inherits from the virtual class, `genView`.

**Objects from the Class**

Objects can be created by calls of the form `new("graphView", ...)`. The initialize method for this class will be created in other packages that use this package (for example, the initialize method will be created in the iSNetwork package).

**Slots**

- **plotDevice**: the plot device number
- **plotPar**: the parameter list for the plot, see `par()`
- **drArea**: an object of class "GtkDrawingArea"
- **dataName**: a character string describing what data are shown in the view
- **win**: an object of class "GtkWindow" that holds the view
- **winNum**: a number that tells what number view this is (for example, the first view created will have `winNum`=1)
- **grLayout**: the Ragraph object, which represents the layout for the graph plot

**Extends**

Class "plotView", directly. Class "genView", by class "plotView".

**Methods**

No methods defined with class "graphView" in the signature.

Class "GSE": A class to represent gene set enrichment data

**Description**

`GSE` is a class to represent gene set enrichment data and will be used in the modelData slot in the `gseModel` object. This class will store all of the information that pertains to performing gene set enrichment.

**Objects from the Class**

Objects can be created by calls of the form `new("GSE", ...)`. 
Slots

- **incidMat**: the incidence matrix that shows the relationship between the genes and the gene sets
- **gTestStat**: the test statistic for the genes relationship with the phenotype
- **gsTestStat**: the test statistic for the gene set
- **expData**: the experimental data (here it will be of class ExpressionSet)
- **descr**: a description of the gene set being studied

Methods

- **incidMat<-**: Sets the incidMat slot
- **incidMat**: Returns the incidMat slot
- **gTestStat<-**: Sets the gTestStat slot
- **gTestStat**: Returns the gTestStat slot
- **gsTestStat<-**: Sets the gsTestStat slot
- **gsTestStat**: Returns the gsTestStat slot
- **expData<-**: Sets the expData slot
- **expData**: Returns the expData slot
- **descr<-**: Sets the descr slot
- **descr**: Returns the descr slot

**gseModel-class**

Class "gseModel": A class to represent a GSE model

Description

gseModel is a class to represent a gene set enrichment (GSE) model. This class inherits from the virtual class, gModel.

Objects from the Class

Objects can be created by calls of the form `new("gseModel", ...)`. The initialize method for this class will be created in other packages that use this package (for example, the initialize method will be created in the iSNetwork package).
Slots

modelData: the model data, which is an object of GSE
linkData: a list of functions that link this model to its parent and child models (if it has any)
virtualData: the data that is needed by the views of this object
modelName: the name of this model
modelVar: a list of variables that refer to the modelData (for instance this may be t-test values that were calculated from the modelData)

Extends

Class "gModel", directly.

Methods

No methods defined with class "gseModel" in the signature. The methods for this class will be created in other packages that use this package like iSNetwork.

heatmapView-class  Class "heatmapView": A class to represent a heatmap view

Description

heatmapView is a class to represent a view that is a heatmap. heatmapView inherits from the class, plotView, which inherits from the virtual class, genView.

Objects from the Class

Objects can be created by calls of the form `new("heatmapView", ...)`. The initialize method for this class will be created in other packages that use this package (for example, the initialize method will be created in the iSNetwork package).

Slots

ordering: a list of of information returned from the heatmap function
plotDevice: the plot device number
plotPar: the parameter list for the plot, see `par()`
drArea: an object of class "GtkDrawingArea"
dataName: a character string describing what data are shown in the view
win: an object of class "GtkWindow" that holds the view
winNum: a number that tells what number view this is (for example, the first view created will have winNum=1)
rowNames: the names of the rows to be included in the heatmap (this allows the original data to be subset in the view)
heatmapView-class

Extends

Class "plotView", directly. Class "genView", by class "plotView".

Methods

ordering<- Sets the ordering slot
ordering Returns the ordering slot
rNames<- Sets the rNames slot
rNames Returns the rNames slot
