**genesym-class**  
**Class** "genesym" and other casting classes

**Description**  
classes that help establish symbol semantics for dispatching

**Objects from the Class**  
Objects can be created by calls of the form `new("genesym", ...), and generally just extend character or numeric so that vector operations are straightforward.

Currently, `genesym` is used to allow HUGO symbols to be passed to `

| chrnum | identifies numerals or numeric constants as indices into the set of chromosomes (no chr prefix is allowed); |
| rsid | identifies dbSNP identifiers; |
| probeId | identifies a string as a microarray probe identifier; |
| snpdepth | identifies a number that will be used as the number of chromosome-specific test results to be retained in any genome-wide screen |

**Slots**  
*Data: Object of class "character"*
featureFilter

**Extends**

Class "character", from data part. Class "vector", by class "character", distance 2. Class characterORMIAME, by class "character", distance 2.

**Author(s)**

VJ Carey <stvjc@channing.harvard.edu>

**Examples**

```r
showClass("genesym")
genesym("CPNE1")
```

---

**featureFilter**

remove unannotated or undesired features from an smlSet instance

**Description**

remove unannotated or undesired features from an smlSet instance

**Usage**

```r
featureFilter(x, requires = c("loc", "autosomal"))
```

**Arguments**

- **x**
  instance of smlSet class
- **requires**
  character vector – if "loc" is present, require that a non-NA value is present in CHRLOC for each feature; if "autosomal" is present, require that CHR value is in 1:22 (presently assumes human genome)

**Value**

revised smlSet instance excluding features no

**Author(s)**

VJ Carey

**Examples**

```r
library(GGtools)
if (!exists("hmceuB36.2021")) data(hmceuB36.2021)
dim(exprs(hmceuB36.2021))
ff = featureFilter(hmceuB36.2021)
dim(exprs(ff))
```
GGbase Package Overview

Description

GGbase Package Overview

Details

This package provides infrastructure for programming related to the genetics of gene expression. The GGtools package makes use of classes and methods defined in this package. GGdata and hmyriB36 packages use the class structures defined in this package for serialized data.

Introductory information is available from vignettes, type \texttt{openVignette}().

Full listing of documented man pages is available in HTML view by typing \texttt{help.start}() and selecting \texttt{GGbase} package from the Packages menu or via \texttt{library(help="GGbase")}.

Author(s)

V. Carey

gwSnpScreenResult-class

\textit{Class "gwSnpScreenResult" – containers for GGtools gwSnpScreen method outputs and allied objects}

Description

Class "gwSnpScreenResult" – container for GGtools gwSnpScreen method outputs and allied objects

Objects from the Class

Objects can be created by calls of the form \texttt{new("gwSnpScreenResult", ...). These will be primarily lists of inference tables (snps are rows, columns are statistics and p-values). Additional slots manage analysis metadata.}

gwSnpScreenResult is intended for genome-wide analysis of expression for a single gene.
cwSnpScreenResult is intended for the restriction to a single chromosome.
multiGwSnpScreenResult is intended for analyses with multiple genes.

Because the vast majority of tests are uninformative, early filtering is important for managing object sizes. Instances of filteredGwSnpScreenResult and filteredMultiGwSnpScreenResult are created when a snpdepth parameter is used with gwSnpTests.
Slots

.data: Object of class "list" containing inference tables (snps are rows, columns are statistics and p-values)
gene: Object of class "character" typically the HUGO symbol of the gene analyzed
psid: Object of class "character" the feature identifier of the associated microarray
annotation: Object of class "character" vector of relevant annotation package identifier names
formula: Object of class "formula" the formula used to fit the model relating expression to genotype

Extends

Class "list", from data part. Class "vector", by class "list", distance 2. Class AssayData, by class "list", distance 2.

Methods

plot and show

Author(s)

VJ Carey <stvjc@channing.harvard.edu>

Examples

showClass("gwSnpScreenResult")
showClass("cwSnpScreenResult")

MAFfilter

restrict SNP in an smlSet to range of minor allele frequencies (MAF)

Description

restrict SNP in an smlSet to range of minor allele frequencies (MAF)

Usage

MAFfilter(x, lower = 0, upper = 1)

Arguments

x smlSet instance
lower numeric lower bound on minor allele frequency for keeping a SNP
upper numeric upper bound on minor allele frequency for keeping a SNP

Details

uses snp.matrix-class summary method from snpMatrix
Value
revised instance of \texttt{smlSet-class}

Author(s)
VJ Carey <stvjc@channing.harvard.edu>

Examples

```r
library(GGtools)
if (!exists("hmceuB36.2021")) data(hmceuB36.2021)
sapply(smList(MAFfilter(hmceuB36.2021, lower=.1)), dim)
```

---

**multiCisTestResult-class**

Class "\texttt{multiCisTestResult}"

---

Description

object to contain results of restricted gene-centric searches for eQTL

Objects from the Class

Objects can be created by calls of the form \texttt{new("multiCisTestResult", ...)}.

Slots

\textbf{.Data}: Object of class \texttt{"list"} – list of results of \texttt{snp.rhs.tests}  
\textbf{conditions}: Object of class \texttt{"list"} – list of runtime conditions encountered  
\textbf{call}: Object of class \texttt{"call"} – for auditing, the call used is saved

Extends

Class \texttt{"list"}, from data part. Class \texttt{"vector"}, by class \texttt{"list"}, distance 2. Class \texttt{"AssayData"}, by class \texttt{"list"}, distance 2.

Methods

\texttt{show} signature(object = "\texttt{multiCisTestResult}"): ...

Author(s)

VJ Carey <stvjc@channing.harvard.edu>

Examples

```r
showClass("\texttt{multiCisTestResult}")
```
plot_EvG-methods  *formal method for visualizing expression distributions vs genotype*

**Description**

boxplot expression vs genotype

**Methods**

gsym = "genesym", rsid = "rsid", sms = "smlSet"  generates an annotated boxplot  
multisnp methods  plot_EvG2 allows specification of a second SNP rsid and shows boxplots over the cross-tabulation of the allele combinations

**Examples**

```
library(GGtools)
data(hmceuB36.2021)
plot_EvG(genesym("CPNE1"), rsid("rs6060535"), hmceuB36.2021)
```

---

**SessionInfo-class**  *Class "SessionInfo" – objects to help stamp an output with information on session state*

**Description**

Class "SessionInfo" – objects to help stamp an output with information on session state

**Objects from the Class**

Objects can be created by calls of the form `new("SessionInfo", ...)`.  

**Slots**

`.S3Class`: Object of class "character" simple cast to allow checking

**Extends**

Class "oldClass", by class "sessionInfo", distance 2.

**Methods**

No methods defined with class "SessionInfo" in the signature.

**Examples**

```
showClass("SessionInfo")
```
Documentation on S4 class "smlSet" an eSet-derived container for snpMatrix lists, allowing efficient combination of SNP chip genotyping with microarray expression data, and allied classes

Description

Objects from the Class

Slots

- `smlEnv`: Object of class "environment" an environment with single key `smList` pointing to a list of package snpMatrix snp.matrix instances
- `organism`: Object of class "character" informal, "Hs" recommended for human
- `assayData`: Object of class "AssayData" intended to hold expression data coordinated with the smlEnv data
- `phenoData`: Object of class "AnnotatedDataFrame" standard sample-level data container from eSet design
- `featureData`: Object of class "AnnotatedDataFrame" standard feature-level metadata container, implied usage is for documenting the expression data elements
- `experimentData`: Object of class "MIAME" standard metadata container from Biobase eSet design
- `annotation`: Object of class "character" vector giving the Bioconductor annotation package (.db type) for decoding expression feature identifiers.
- `.__classVersion__`: Object of class "Versions" class version tracking metadata

Extends

- Class `eSet`, directly. Class `VersionedBiobase`, by class "eSet", distance 2. Class `Versioned`, by class "eSet", distance 3.

Methods

- `smList` signature(x = "smlSet"): retrieves the actual list of snp.matrix entities
- `smlEnv` signature(x = "smlSet"): retrieves the environment holding snp.matrix entities
- `exprs` signature(x = "smlSet"): retrieves the matrix of expression values
- `snps` signature(x = "smlSet", chr = "chrnum"): retrieves the raw matrix of genotype values (snp.matrix instance from snpMatrix package
- `combine`: concatenates expression data and forms intersection of SNP sets
- `getAlleles(smlSet, rsid)`: returns A/B notations for SNP determined by rsid
Note
We have included a method for snp.matrix instances that accepts an rsid instance as a column selector.

Author(s)
VJ Carey <stvjc@channing.harvard.edu>

See Also
GGtools package makes extensive use of these classes and methods.

Examples
```r
showClass("smlSet")
```

---

**smlSummary**

*class and function to summarize frequency information on genotypes in an smlSet*

---

**Description**
generates information on sample size, minor allele frequency, specific call frequencies, and HWE test results on all SNP in an smlSet

**Usage**
```r
smlSummary(x)
```

**Arguments**

- `x` instance of `smlSet-class`

**Details**
to control volume of printout a simple list extending class is defined for show method

**Value**
Instance of smlSummary class, which simply extends list. Each list element is a matrix of results provided by `summary,snp.matrix-method`.

**Author(s)**
VJ Carey <stvjc@channing.harvard.edu>

**Examples**
```r
library(GGtools)
if (!exists("hmceuB36.2021")) data(hmceuB36.2021)
smlSummary(hmceuB36.2021)
```
snpLocs.Hs

SNP location accessor

Description

SNP location accessor

Usage

snpLocs.Hs(cnum, rsid)

Arguments

cnum  chrnum instance indicating chromosome
rsid  rsid instance giving dbSNP ids for snps of interest

Details

The SNPlocs.Hsapiens.dbSNP.* package is curated by Bioconductor and maintains location and allele information on SNP.

The hsSnpLocs environment is available through data(hsSnpLocs), and contains a unified representation of the information in the SNPlocs package (which is only available through various chromosome-specific calls).

Value

two-row matrix – top row is numeric suffix of dbSNP ids, bottom row is location, genome-wide if chrnum is missing

Author(s)

Vince Carey <stvjc@channing.harvard.edu>

Examples

library(GGtools)
data(hmceuB36.2021)
nn21 = colnames(smList(hmceuB36.2021)[["21"]])
length(nn21)
ss = snpLocs.Hs(chrnum(21), rsid(nn21))
dim(ss)
# notes that the locations available are not completely
# congruent with those asserted in HapMap data
snpsNear

obtain list of rs numbers for snps near a gene

Description
obtain list of rs numbers for snps near a gene

Usage
snpsNear(sym, radius=1e+05, chrnum, ...)

Arguments
sym instance of genesym class [e.g., use genesym(string) for gene 'string'], or of rsid class, or of numeric class. An instance of GSEABase-class can also be supplied if it has geneIdType AnnotationIdentifier.

radius number of base-pairs in each direction to look

chrnum chrnum instance .. optional

... options not now in use

Details
simple arithmetic based on output of snpLocs.Hs

Value
character vector of rsxxxxxx, dbSNP id, according to locations from SNPlocs.Hsapiens.dbSNP.20071016 package, as transferred to snpLocs.Hs resource in GGBase

note that an attribute 'target' is returned, a named vector with components chr and loc describing chromosome and location of the target for which nearby SNPs are sought

Note
first invocation can take longer than subsequent, if snpLocs.Hs has not been invoked previously

Author(s)
Vince Carey <stvjc@channing.harvard.edu>

Examples
```r
earc = snpsNear(genesym("CPNE1"), 10000, chrnum(20))
library(GGtools)
data(hmceuB36.2021)
ss = smList(hmceuB36.2021)[[1]]
# following calculation requires new "[" for j an instance of rsid
clo = ss[, rsid(snpsNear(rsid("rs6060535"), rad=1500, chrnum(20))) ]
clo
# try a gene set
library(GSEABase)
sl = GeneSet(c("CPNE1", "ADA"), geneIdType=SymbolIdentifier())
s2 = sl
```
geneIdType(s2) = AnnotationIdentifier("illuminaHumanv1.db")
s2
sapply(snpSNear(s2), length)
