arrayNew

Create a new x11 device

Description

Create a new x11 device with dimensions suited to be used with imageCodelink().

Usage

arrayNew(f=2, chip="rwgcod")

Arguments

chip character; Codelink chip to be used in imageCodelink.

f numerical; scaling factor.

Author(s)

Diego Diez

Examples

## Not run:

data(codelink.example)
arrayNew()
imageCodelink(codelink.example)
## End(Not run)

arraySize

Determine the size of the array

Description

When loading Codelink arrays in text format (as exported from the Codelink software) this function retrieves the correct size of the array. This is useful because those files contain and indetermined number of empty lines at the end. Thus, reading the entire data matrix don’t works.

Note

Not meant to be used directly.

Author(s)

Diego Diez
as.matrix.Codelink  Return a matrix of intensity values

Description
Takes a Codelink object and returns a matrix with the intensity values available.

Usage

```r
## S3 method for class 'Codelink':
as.matrix(x, ...)
```

Arguments

- `x`: an object of class "Codelink".
- `...`: additional arguments added to generic as.matrix since R-2.5.x

Value
A matrix with the intensity values.

Author(s)
Diego Diez

See Also
as.matrix

Examples

```r
## Not run:
data(codelink.example)
mat <- as.matrix(codelink.example)
is(mat)
## End(Not run)
```

bkgdCorrect  Background correction of intensity values.

Description
Takes a Codelink object with Spot mean and Bkgd median values and corrects applying one of the methods available.

Usage

```r
bkgdCorrect(object, method = "half", preserve = FALSE, verbose = FALSE, offset = 0)
```
Arguments

object character; an object of class "Codelink".
method character; the correction method to use, one of "none", "subtract", "half" and "normexp".
preserve logical; if Smean and Bmedian slots should be preserved.
verbose logical; if TRUE print some information with method normexp.
offset numeric; value to add to intensities.

Details

Available methods are: . none: left intensities untouched. . subtract: simple subtraction of Bkgd median from Spot mean. . half: the same as above but aboid negative values setting all intensity values below zero to 0.5. . normexp: apply normexp background adjustment from package limma.

Value

An object of class Codelink with corrected intensity values, that is Ri slot.

Author(s)

Diego Diez

Examples

## Not run:
data(codelink.example)
codelink.example <- bkgdCorrect(codelink.example, method = "half")
## End(Not run)

Codelink-class

Class Codelink

Description

This is the storage class for Codelink data

Objects from the Class

Object are created after reading text codelink files with read.Codelink()

Slots

sample: Object of class "character" containing the sample names
file: Object of class "character" containing the file names
name: Object of class "character" containing the probe ID
method: Object of class "list." containing log information
Smean: Object of class "matrix" containing spot mean intensities
Bmedian: Object of class "matrix" containing background median intensities
Ri: Object of class "matrix" containing raw intensities
Ni: Object of class "matrix" containing normalized intensities  

snr: Object of class "matrix" containing signal to noise ratio values  

flag: Object of class "character" containing assigned flags  

Methods  

Note  

More details are cotained in the vignette  

Author(s)  

Diego Diez  

Examples  

```r  
## Not run:  
data(codelink.example)  
## End(Not run)  
```

### codelink.example  

Dataset of class 'Codelink'  

Description  

Dataset from a h20kcod (Codelink Human UniSet I 20k) array containing 2 samples and ~20000 probes.  

Usage  

```r  
data(codelink.example)  
```

Format  

A Codelink object containing 20469 probes and 2 samples.  

Author(s)  

Diego Diez.
codelink.exprset  

Dataset of class 'CodelinkSet'

Description

Dataset from a h20kcod (Codelink Human UniSet I 20k) array containing 4 samples and ~20000 probes.

Usage

data(codelink.example)

Format

A Codelink object containing 20469 probes and 4 samples.

Author(s)

Diego Diez

createWeights  

Create weight for Codelink chips

Description

Create a weight matrix to be used in limma.

Usage

createWeights(object, type=NULL)

Arguments

object  
an object of class "Codelink".

type  
weight assigned to each Probe_type.

Author(s)

Diego Diez

Examples

## Not run:

data(codelink.example)

w <- createWeights(codelink.example, type = list(FIDUCUAL = 0.1))

## End(Not run)
cutCV

Calculate cutoff based in CV.

Description

Takes a Codelink object and calculate cutoff based in CV.

Usage

cutCV(object, subset=c(1:dim(object)[2]))

Arguments

object an object of class "Codelink".
subset subset of arrays to calculate cutoff with

Details

First it computes the median of CV for each gene over all arrays. Then it computes the mean and sd of all medians. Finally:
cutoff = mean + 3 * sd

Author(s)

Diego Diez

Examples

## Not run:
  # data: Normalized Codelink object merged.
  cutoff <- cutCV(data)
## End(Not run)

decDetect
determine decimal type of Codelink files

Description

Determine decimal type of Codelink files.

Usage

decDetect(file, nlines)

Arguments

file the file to be read.
nlines number of lines to skip.
**dim.Codelink**

**Value**

Decimal type.

**Author(s)**

Diego Diez

---

**dim.Codelink**

*Return the dimension of a Codelink object.*

**Description**

Takes a Codelink object and returns the dimension (genes x samples).

**Usage**

```r
## S3 method for class 'Codelink':
dim(x)
```

**Arguments**

- `x` an object of class "Codelink".

**Value**

A numeric vector with the dimensions.

**Author(s)**

Diego Diez

**Examples**

```r
## Not run:
data(codelink.example)
dim(codelink.example)
## End(Not run)
```
**fc2Cond**  
*Select probes based on fold change calculation*

**Description**  
Takes a Codelink object and calculate fold changes (M) between two conditions (samples). Then select genes based on those who pass the passed cutoff.

**Usage**  
```
fc2Cond(object, cond1=NULL, cond2=NULL, fc=1.0, verbose=FALSE)
```

**Arguments**
- **object**: an object of class "Codelink".
- **cond1**: numeric or character; First condition to compute M.
- **cond2**: numeric or character; Second condition to compute M.
- **fc**: value of the fold change cutoff
- **verbose**: logical; if some information is printed on the console.

**Details**  
Conditions can be passed as characters or as numeric index from the sample slot. The intensities are internally transformed to log2 if needed. The M value is computed as:

\[ M = \text{cond1} - \text{cond2} \]

**Value**  
A logical vector indicating which genes pass the cutoff

**Author(s)**
Diego Diez

---

**imageCodelink**  
*Image plot of Codelink arrays*

**Description**  
Plot and image of a Codelink array if the layout information is found.

**Usage**
```
imageCodelink(object, array = 1, what = "bg",
              low="black", high="white", mar=c(1,1,1,1),
              gr=1, gc=1, log.it=FALSE, ...)
```
logCodelink

Arguments

object an object of class "Codelink".
array array to be used.
what with data plot: bg, smean, ri, ni.
low color used for low intensities.
high color used for high intensities.
mar character vector specifying margings.
gc numerical; number of grid columns.
gr numerical; number of grid rows.
log.it logical; if TRUE data is log2 transformed (if not yet).
... additional arguments passed to image.

Author(s)

Diego Diez

Examples

## Not run:
data(codelink.example)
imageCodelink(codelink.example)
## End(Not run)

Description

Takes a Codelink object and apply logCodelink to intensity values.

Usage

logCodelink(object)

Arguments

object an object of class "Codelink" or a list of genes.

Value

A Codelink object with logCodelink intensities.

Author(s)

Diego Diez

See Also

log2
mergeArray

Merge Codelink Bioarrays Data

Description

Merge data in a Codelink Object corresponding to same samples. Need a vector indicating the classes and an optional vector indicating the labels of the merged samples.

Usage

mergeArray(object, class, names=NULL, method="mean", log.it=FALSE, merge.snr=TRUE)

Arguments

object 
an object of class "Codelink".

class 
a numeric vector indicating the classes.

names 
an optional character vector indicating labels for each class.

method 
the method used to summarize. Currently only "mean" supported.

log.it 
logical; a logical indicating if log2 values should be returned.

merge.snr 
logical; a logical indicating if SNR values should be merged.

Value

An object of class "Codelink".

Author(s)

Diego Diez

Examples

## Not run:
data(codelink.example)
codelink.example <- bkgdCorrect(codelink.example)
codelink.example <- normalize(codelink.example, log.it = FALSE)
codelink.example <- mergeArray(codelink.example, class = c(1,1),
                               names = "SAMPLE", log.it = TRUE)
## End(Not run)
na2false  

*Set NAs to FALSE*

**Description**

Takes a logical vector as input and set all NAs to FALSE. This may happens when comparison is done on NA values.

**Usage**

```r
na2false(x)
```

**Arguments**

- `x`  
  a logical vector.

**Value**

A logical vector without NAs.

**Author(s)**

Diego Diez

**Examples**

```r
## Not run:
a <- c(1, 2, 3, NA, 5)
b <- c(5, 4, NA, 2, 1)
se1 <- a > b
se1 <- na2false(se1)
## End(Not run)
```

---

**Nondocumented-objects**

*Here goes every undocumented function.*

**Description**

Every function without help page is redirected here. Either because it is not intended to have a help page or because it is a bug. If you think it is the later please contact the package maintainer.

NOTE: Actually it is none of that reasons but the fact that the package is under heavy development.

**Author(s)**

Diego Diez
normalize.loess

Normalized chips using cyclic loess.

Description
Takes a matrix and apply cyclic loess normalization. It is based in normalize.loess from package affy but supports NA.

Usage
```
normalize.loess(mat, subset = sample(1:(dim(mat)[1]),
       min(c(5000, nrow(mat)))), epsilon = 10^-2, maxit = 1, log.it = TRUE,
       verbose = FALSE, span = 2/3, family.loess = "symmetric", weights = NULL)
```

Arguments
- **mat**: a matrix with columns containing the values of the chips to normalize.
- **subset**: a subset of the data to fit a loess to.
- **epsilon**: a tolerance value (supposed to be a small value - used as a stopping criterium).
- **maxit**: maximum number of iterations.
- **log.it**: logical. If TRUE it takes the log2 of mat.
- **verbose**: logical. If TRUE displays current pair of chip being worked on.
- **span**: parameter to be passed the function loess.
- **family.loess**: parameter to be passed the function loess. "gaussian" or "symmetric" are acceptable values for this parameter.
- **weights**: a vector of weights for the individual measurements.

Value
A matrix of normalized values.

Author(s)
Diego Diez

Examples
```
## Not run:
mat <- matrix(sample(500), 100, 5)
mat <- normalize.loess(mat)
## End(Not run)
```
normalize  

Normalization wrapper for Codelink objects.

Description

Takes a Codelink object and applies normalization to intensity values.

Usage

normalize(object, method = "quantiles", log.it = TRUE, preserve = FALSE, weights = NULL, verbose = FALSE)

Arguments

object  
an object of class "Codelink".

method  
method to use in normalization.

log.it  
logical; if data should be log2.

preserve  
logical; if Ri slot should be preserved.

weights  
weights vector for method CyclicLoess.

verbose  
should informative output be printed.

Details

Currently supported methods include "loess", "quantiles" and "median". Median normalization is analogous to the default method applied for the manufacturer in the Codelink software. Loess is a modified version of CyclicLoess implemented in the affy package, allowing missing values and weights. Quantile normalization uses the normalizeQuantiles() function in the limma package.

Value

A Codelink object with normalized intensity values.

Author(s)

Diego Diez

Examples

## Not run:
data(codelink.example)
  # Background correction.
  codelink.example <- bkgdCorrect(codelink.example, method = "half")
  # Normalization.
  codelink.example <- normalize(codelink.example, method = "quantile")

## End(Not run)
plotCorrelation  

Plot correlation scatterplot between two arrays

Description

Takes a Codelink object as argument and plot Correlation scatterplot of two arrays.

Usage

plotCorrelation(object, x=1, y=2, cutoff=FALSE, label="type", title=NULL, xlim=NULL, ylim=NULL)

Arguments

- object: an object of class "Codelink".
- x: array to be used in x axis.
- y: array to be used in y axis.
- cutoff: cutoff used to show fold change.
- label: labels to shown.
- title: The title of the plot.
- xlim: range for the X axis.
- ylim: range for the Y axis.

Author(s)

Diego Diez

See Also

plot

Examples

```r
## Not run:
data(codelink.example)
plotCorrelation(codelink.example)
## End(Not run)
```

plotCV  

Plot of CV

Description

Takes a Codelink object and plot de distribution of CV after applying mergeCodelink.

Usage

plotCV(object, subset=c(1:dim(object)[2]), cutoff=NULL, title=NULL, legend=FALSE)
plotDensities

**Arguments**

- **object**: an object of class "Codelink".
- **subset**: subset of arrays to plot.
- **cutoff**: cutoff of CV to be shown.
- **title**: title of the plot.
- **legend.cex**: factor to apply to the fonts in the legend to fit.

**Author(s)**

Diego Diez

---

**plotDensities**  
**Plot Densities**

**Description**

Takes a Codelink object and plot the distributions of intensities.

**Usage**

```r
plotDensities(object, subset=1:dim(object)[2], title=NULL, legend.cex=1, what=NULL)
```

**Arguments**

- **object**: an object of class "Codelink".
- **subset**: subset of arrays to be plotted (default: all).
- **title**: title of the plot.
- **legend.cex**: font factor use in legend to fit.
- **what**: what data to plot, may be "bg", "smean", "snr", "ri" or "ni"

**Author(s)**

Diego Diez

**Examples**

```r
## Not run:
data(codelink.example)
plotDensities(codelink.example)
## End(Not run)
```
plotMA  

Description

Takes a Codelink object and plot M vs A.

Usage

plotMA(object, array1 = 1, array2 = NULL, cutoff = c(-1, 1), label = NULL, 
type = NULL, high.list = NULL, high.col = "blue", high.pch = 21, 
high.bg = "cyan", snr = NULL, snr.cutoff = 1, legend.x = NULL, pch 
subset = NULL, title = NULL, xlim = NULL, ylim = NULL)

Arguments

object  an object of class "Codelink" or "MAarrayLM".
array1 first array to be used.
array2 second array to be used.
cutoff cutoff to be used as fold change markeer.
label type of labeling used in legend.
type spot type information.
high.list list of genes highlighted.
high.col color used for high genes.
high.pch pch used for high genes.
high.bg background color used for high genes.
snr vector with SNR values, usually, taking rowMeans() from a SNR matrix.
snr.cutoff SNR cutoff used for label spots.
legend.x relative position of the legend.
pch pch style used to main spots.
subset subset of spots used to plot based on 'type' slot.
title title of the plot.
xlim range for the X axis.
ylim range for the Y axis.

Details

This function has suffered recent re-working, to increase the usability and to clean a little bit the code.

If array2 is NULL a median array is computed using all available arrays. Then the values of M and A are computed using the following formula:

\[ M = array2 - array1 \]
\[ A = (array2 + array1) / 2 \]

If type information is available in the Codelink object, or provided throught the 'type' argument, spots are colored based on that. DISCOVERY spots are plotted black with pch = "." whereas the
other classes are plotted with different background colors, using gray as border to increase contrasts. For that pch = 21 is used. If snr is specified as label option, the SNR is used to label spots, if available in the Codelink object. In this case, the mean SNR across all arrays is used when array2 = NULL.

Some parameters may not be working right now, as the new function is using a different method to labels spots.

The legend is 'automagically' located, but this can be overridden with the legend.x argument.

In addition, a subset of the spots can be plotted based on type information when available. This allows, for example, to plot only DISCOVERY spots.

Author(s)

Diego Diez

Examples

```R
## Not run:
data(codelink.example)
plotMA(codelink.example)
## End(Not run)
```

---

**printHead**

*Print briefly a Codelink object*

**Description**

Takes a Codelink object and print a summary information of the data estored. It is based on print-Head() from package limma.

**Usage**

```R
printHead(x)
```

**Arguments**

x an object of class "Codelink".

**Author(s)**

Diego Diez
**readCodelink**

**Read Codelink Bioarrays Data**

**Description**
Read data exported as text by Codelink Software. It reads values (normalized by Codelink Software or not) flags and information about probes.

**Usage**

```r
readCodelink(files=list.files(pattern="TXT"), sample.name=NULL, flag, dec=NULL, type="Spot", preserve=FALSE, verbose=2, file.type="Codelink", check=TRUE, fix=FALSE)
```

**Arguments**
- `files` list of files to read.
- `sample.name` vector of same length as files with sample names.
- `flag` list with values to assign based on Flag quality values.
- `dec` character indicating the decimal character used in the files.
- `type` character indicating which base value to read from files.
- `preserve` logical, if TRUE Bkgd_stdev slot is not removed (if present).
- `verbose` numerical, set the level of information. Level 2 set as old behaviour. Level > 2 output some debug info.
- `file.type` exported file type, currently Codelink or XLS file formats supported.
- `check` logical, check for probe order consistency.
- `fix` logical, try to fix probe order consistency.

**Value**
An object of class "Codelink".

**Author(s)**
Diego Diez

**See Also**
- `read.table`

**Examples**
```
## Not run:
# reading default extension (TXT).
data <- readCodelink()

# specify a different one.
files <- list.files(pattern = "txt")
data <- readCodelink(files = files)
```
## readHeader

### Description

Read the header of Codelink files and obtain useful information.

### Usage

```r
readHeader(file, dec=FALSE)
```

### Arguments

- **file**: File to read.
- **dec**: logical; If TRUE determine decimal point.

### Value

A list with header and other useful information.

### Author(s)

Diego Diez

### Examples

```r
## Not run:
files <- list.files(pattern = "TXT")
head <- readHeader(files[1])
## End(Not run)
```

## readHeaderXLS

### Description

Read the header of Codelink files and obtain useful information.

### Usage

```r
readHeaderXLS(file, dec=FALSE)
```

### Arguments

- **file**: File to read.
- **dec**: logical; If TRUE determine decimal point.
reportCodelink

Details

This function is not meant to be used by normal users.

Value

A list with header and other usefull information.

Author(s)

Diego Diez

Examples

```r
## Not run:
files <- list.files(pattern = "TXT")
head <- readHeaderHeader(files[1])
## End(Not run)
```

---

**reportCodelink**  
Write a report of genes selected in HTML

Description

Takes a list of genes as argument and writes an HTML page containing information about these genes: Unigene, Genbank, Entrez Gene, etc.

Usage

```r
reportCodelink(object, chip, filename = NULL, title = "Main title", probe.type = FALSE, other = NULL, other.ord = NULL)
```

Arguments

- **object**: an object of class "Codelink" or a list of genes.
- **chip**: the chip description package.
- **filename**: file name used in the report.
- **title**: title used in the report.
- **probe.type**: logical; if TRUE Probe type information is written.
- **other**: list of vectors containing aditional values to add to the report.
- **other.ord**: slot name in other to order genes by.

Value

Nothing, only the HTML file generated.

Author(s)

Diego Diez

See Also

- htmlpage
**SNR**

*Calculate SNR*

**Description**

Compute SNR inside read.Codelink.

**Usage**

```r
SNR(Smean, Bmedian, Bstdev)
```

**Arguments**

- **Smean**: matrix of Smean intensities.
- **Bmedian**: matrix of background median intensities.
- **Bstdev**: matrix of background standard deviation.

**Author(s)**

Diego Diez

---

**selCV**

*Select based on CV cutoff.*

**Description**

Takes a Codelink object and select genes based on CV cutoff.

**Usage**

```r
selCV(object, cutoff)
```

**Arguments**

- **object**: an object of class "Codelink".
- **cutoff**: cutoff normally calculated with cutCV()

**Value**

A logical vector.

**Author(s)**

Diego Diez
writeCodelink

Write a Codelink object to file.

Description
Export of the data from a codelink object to a text file.

Usage
```r
writeCodelink(object, file, dec = ".", sep = "\t", flag = FALSE, chip)
```

Arguments
- `object`: an object of class "Codelink".
- `file`: filename to write object to.
- `dec`: decimal character to use.
- `sep`: delimiter character to use.
- `flag`: should the Codelink flags be written.
- `chip`: chip package to use, normally guessed.

Details
By default, intensities and SNR are wrote to the file. If set, the flag are also output. The header have "INTENSITY_", "SNR_" and "FLAG_" respectibely appendend to the sample name for those values. The default delimiter is the tab character, but that can be set with the sep argument. The default decimal character is the point.

Author(s)
Diego Diez

Examples
```r
## Not run:
data(codelink.example)
writeCodelink(codelink.example, file = "foo.txt")
## End(Not run)
```
