Index 29
activeView-methods  Accessing the active view

Description
Get the active view.

Methods
The following methods are defined by rtracklayer.

```r
object = "BrowserSession" activeView(object): Gets the active BrowserView from a browser session.
activeView(object) <- value: Sets the active BrowserView in a browser session.
```

BasicTrackLine-class

Class "BasicTrackLine"

Description
The type of UCSC track line used to annotate most types of tracks (every type except Wiggle).

Objects from the Class
Objects can be created by calls of the form `new("BasicTrackLine", ...)` or parsed from a character vector track line with `as(text, "BasicTrackLine")` or converted from a `WigTrackLine` using `as(wig, "BasicTrackLine")`.

Slots
- `itemRgb`: Object of class "logical" indicating whether each feature in a track uploaded as BED should be drawn in its specified color.
- `useScore`: Object of class "logical" indicating whether the data value should be mapped to color.
- `group`: Object of class "character" naming a group to which this track should belong.
- `db`: Object of class "character" indicating the associated genome assembly.
- `offset`: Object of class "numeric", a number added to all positions in the track.
- `url`: Object of class "character" referring to additional information about this track.
- `htmlUrl`: Object of class "character" referring to an HTML page to be displayed with this track.
- `name`: Object of class "character" specifying the name of the track.
- `description`: Object of class "character" describing the track.
- `visibility`: Object of class "character" indicating the default visible mode of the track, see UCSCTrackModes.
- `color`: Object of class "integer" representing the track color (as from col2rgb).
- `priority`: Object of class "numeric" specifying the rank of the track.
blocks-methods

Extends

Class "TrackLine", directly.

Methods

\texttt{as(object, "character"')}  Export line to its string representation.
\texttt{as(object, "WigTrackLine"')}  Convert this line to a WIG track line, using defaults for slots not held in common.

Author(s)

Michael Lawrence

References

http://genome.ucsc.edu/goldenPath/help/customTrack.html#TRACK for the official documentation.

See Also

WigTrackLine for Wiggle tracks.

blocks-methods  Get blocks/exons

Description

Obtains the block ranges (subranges, usually exons) from an object, such as a RangedData imported from a BED file.

Usage

\texttt{blocks(x, ...)}

Arguments

\begin{itemize}
\item \texttt{x} \hspace{1cm} The instance from which to obtain the block/exon information. Currently must be a RangedData, presumably imported with \texttt{import.bed}.
\item \texttt{...} \hspace{1cm} Additional arguments for methods
\end{itemize}

Details

For the RangedData method, there must be two columns in \texttt{x}: blockStarts and blockSizes, each field of which should be a comma-separated list of block starts and widths, respectively. This comes from the BED specification.

Author(s)

Michael Lawrence

See Also

import.bed for importing a track from BED, which can store block information.
browseGenome

Browse a genome

Description

A generic function for launching a genome browser.

Usage

```r
browseGenome(object, ...)  
## S4 method for signature 'RangedDataORRangedDataList':
browseGenome(object = RangedDataList(),
browser = "ucsc", range = range(tracks),
view = TRUE, trackParams = list(), viewParams = list(), ...)
```

Arguments

- **object**: A list of `RangedData` instances, e.g. a `RangedDataList` instance.
- **browser**: The name of the genome browser.
- **range**: The `RangesList` to display in the initial view.
- **view**: Whether to open a view.
- **trackParams**: Named list of parameters to pass to `track<-`.
- **viewParams**: Named list of parameters to pass to `browserView`.
- **...**: Arguments corresponding to slots in `RangesList` that override those in `range`.

Value

Returns a `BrowserSession`.

Author(s)

Michael Lawrence

See Also

`BrowserSession` and `BrowserView`, the two main classes for interfacing with genome browsers.

Examples

```r
## Not run:
## open UCSC genome browser:
browseGenome()
## to view a specific range:
range <- GenomicRanges("hg18", "chr22", 20000, 50000)
browseGenome(range = range)
## a slightly larger range:
browseGenome(range = range, end = 75000)
## with a track:
track <- import(system.file("tests", "v1.gff", package = "rtracklayer"))
browseGenome(RangedDataList(track))

## End(Not run)
```
Description

An object representing a genome browser session. Each session corresponds to a set of loaded tracks and a set of BrowserView instances. Note that this is a virtual class; a concrete implementation is provided by each backend driver.

Objects from the Class

A virtual Class: No objects may be created from it. See browserSession for obtaining an instance of an implementation for a particular genome browser.

Methods

This specifies the API implemented by each browser backend. Note that a backend is not guaranteed to support all operations, and that each backend often has additional parameters for each of the methods. See the backend-specific documentation for more details. The only built-in backend is UCSCSession.

browserView(object, range = range(object), track = trackNames(object), ...) Constructs a BrowserView of range for this session.

browserViews(object, ...) Gets the BrowserView instances belonging to this session.

activeView(object, ...) Returns the BrowserView that is currently active in the session.

range(x, ...) Gets the RangesList representing the range of the genome currently displayed by the browser (i.e. the range shown by the active view) or a default value (possibly NULL) if no views exist.

getSeq(object, range = range(object), ...) gets a genomic sequence of range from this session.

sequence(object, ...) <- value Loads a sequence into the session.

track(object, name = deparse(substitute(track)), view = TRUE, ...) <- value Loads one or more tracks into the session and optionally open a view of the track.

x[[i]] <- value Loads the track value into session x, under the name i. Shortcut to above.

x$name <- value Loads the track value into session x, under the name name. Shortcut to above.

track(object, ...) Gets a track from a session as a RangedData.

x[[i]] Gets the track named i from session x. A shortcut to track.

x$name Gets the track named name from session x. A shortcut to track.

trackNames(object, ...) Gets the names of the tracks stored in this session.

close(con, ...) Close this session.

show(object, ...) Output a textual description of this session.

Author(s)

Michael Lawrence
BrowserView-class

See Also

browserSession for obtaining implementations of this class for a particular genome browser.

browserSession-methods

Get a genome browser session

Description

Methods for getting browser sessions.

Methods

The following methods are defined by rtracklayer.

object = "character" browserSession(object, ...): Creates a BrowserSession from a genome browser identifier. The identifier corresponds to the prefix of the session class name (e.g. "ucsc" in "UCSCSession"). The arguments in ... are passed to the initialization function of the class.

object = "browserView" Gets the BrowserSession for the view.

object = "missing" Calls browserSession("ucsc", ...).

BrowserView-class

Class "BrowserView"

Description

An object representing a genome browser view of a particular segment of a genome.

Objects from the Class

A virtual Class: No objects may be created from it directly. See browserView for obtaining an instance of an implementation for a particular genome browser.

Slots

session: Object of class "BrowserSession" the browser session to which this view belongs.

Methods

This specifies the API implemented by each browser backend. Note that a backend is not guaranteed to support all operations. See the backend-specific documentation for more details. The only built-in backend is UCSCView.

browserSession(object) Obtains the BrowserSession to which this view belongs.

close(object) Close this view.

range(object) Obtains the RangesList displayed by this view.

trackNames(object) Gets the names of the visible tracks in the view.
trackNames(object) <- value  Sets the visible tracks by their names.

show(object)  Outputs a textual description of this view.

visible(object)  Get a named logical vector indicating whether each track is visible.

visible(object) <- value  Set a logical vector indicating the visibility of each track, with the same names and in the same order as that returned by visible(object).

Author(s)

Michael Lawrence

See Also

browserView for obtaining instances of this class.

browserView-methods

Getting browser views

Description

Methods for creating and getting browser views.

Usage

browserView(object, range, track, ...)

Arguments

object  The object from which to get the views.
range  The RangesList to display.
track  List of track names to make visible in the view.
...  Arguments to pass to methods

Methods

The following methods are defined by rtracklayer.

object = "UCSCSession" browserView(object, range = range(object), track = trackNames(object), imagewidth = 800, ...): Creates a BrowserView of range with visible tracks specified by track. The imagewidth parameter specifies the width of the track image in pixels. track may be an instance of UCSCTrackModes. Arguments in ... are passed to ucscTrackModes to create the UCSCTrackModes instance that will override modes indicated by the track parameter.

Examples

## Not run:
session <- browserSession()
browserView(session, GenomicRanges(20000, 50000, "chr2"))
## only view "knownGene" track
browserView(session, track = "knownGene")
## End(Not run)
browserViews-methods

Getting the browser views

Description

Methods for getting browser views.

Methods

The following methods are defined by rtracklayer.

Gets the instances of BrowserView in the session.

See Also

object = "UCSCSession" browserView for creating a browser view.

Examples

## Not run:
session <- browseGenome()
browserViews(session)
## End(Not run)

cpneTrack

CPNE1 SNP track

Description

A RangedData object (created by the GGtools package) with features from a subset of the SNPs on chromosome 20 from 60 HapMap founders in the CEU cohort. Each SNP has an associated data value indicating its association with the expression of the CPNE1 gene according to a Cochran-Armitage 1df test. The top 5000 scoring SNPs were selected for the track.

Usage

data(cpneTrack)

Format

Each feature (row) is a SNP. The association test scores are accessible via score.

Source

Vince Carey and the GGtools package.

Examples

data(cpneTrack)
plot(start(cpneTrack), score(cpneTrack))
Description

These functions output RangedData instances in various formats.

Usage

```r
export.gff(object, con, version = c("1", "2", "3"), source = "rtracklayer")
export.gff1(object, con, ...)
export.gff2(object, con, ...)
export.gff3(object, con, ...)
export.bed(object, con, wig = FALSE, color = NULL, ...)
export.wig(object, con,
dataFormat = c("auto", "bed", "variableStep", "fixedStep"), ...)
export.ucsc(object, con, subformat = c("auto", "gff1", "wig", "bed"), ...)
```

Arguments

- `object`: The object to export, such as a RangedData. If a UCSCData, the track line information is output. In the case of export.ucsc, a RangedDataList object with possibly multiple tracks is supported.
- `con`: The connection to which the object is exported.
- `version`: The GFF version, either "1", "2" or "3" (default is "1").
- `source`: The source of the GFF information, for GFF.
- `wig`: Whether to output the WIG variant of BED lines, not to be used directly.
- `color`: Recycled vector of colors, as interpreted by col2rgb for BED features. If NULL, the color column in the featureData is used, if any.
- `dataFormat`: The format of the data lines for WIG tracks, see references. The "auto" format uses the most efficient format possible.
- `subformat`: The format of the tracks within the UCSC container. If "auto", "wig" is used for numeric data, else "bed".
- `...`: For export.gff1, export.gff2 and export.gff3: arguments to pass to export.gff. For export.bed and export.wig: arguments to pass to methods. For export.ucsc: arguments to pass to export.subformat or to set on the slots of the TrackLine subclass corresponding to subformat.

Value

If con is missing, a character vector containing the string output, otherwise nothing.

WIG  http://genome.ucsc.edu/goldenPath/help/wiggle.html
UCSC  http://genome.ucsc.edu/goldenPath/help/customTrack.html

See Also

See export for the high-level interface to these functions.

Examples

dummy <- file() # dummy file connection for demo
track <- import(system.file("tests", "bed.wig", package = "rtracklayer"))
## output a track as GFF2
export.gff(track, dummy, version = "2")
## equivalently
export.gff2(track, dummy)
## output as WIG string in variableStep format
wig <- export.wig(track, dummy, dataFormat = "variableStep")
## output multiple tracks in UCSC meta-format
track2 <- import(system.file("tests", "v1.gff", package = "rtracklayer"))
## output to WIG with BED line format
export.ucsc(RangedDataList(track, track2), dummy, subformat = "wig", dataFormat = "bed")

export  

Export objects to connections

Description

Exports (serializes) an object in a given format to a given connection.

Usage

export(object, con, format, ...)

Arguments

object  The object to export.
con  The connection to which the object is exported. If this is a character vector, it is assumed to be a filename and a corresponding file connection is created and then closed after exporting the object. If missing, the function will return the output as a character vector, rather than writing to a connection.
format  The format of the output. If missing and con is a filename, the format is derived from the file extension.
...  Parameters to pass to the format-specific export routine.
Details

This function delegates to another function, depending on the specified format. The name of the
delegate is of the form `export.format` where `format` is specified by the `format` argument.

Value

If `con` is missing, a character vector containing the string output. Otherwise, nothing is returned.

Author(s)

Michael Lawrence

See Also

`import` for the reverse

Examples

```r
track <- import(system.file("tests", "v1.gff", package = "rtracklayer"))
## Not run: export(track, "my.gff", version = "3")
## equivalently,
## Not run: export(track, "my.gff3")
## or
## Not run:
con <- file("my.gff3")
export(track, con, "gff3")
close(con)

## End(Not run)
## or as a string
export(track, format = "gff3")
```

Description

Gets the identifiers of the loaded genome browser drivers.

Usage

```r
genomeBrowsers(where = topenv(parent.frame()))
```

Arguments

- `where` The environment in which to search for drivers.

Details

This searches the specified environment for classes that extend `BrowserSession`. The prefix of
the class name, e.g. "ucsc" in "UCSCSession", is returned for each driver.
Value

A character vector of driver identifiers.

Author(s)

Michael Lawrence

See Also

`browseGenome` and `browserSession` that create `browserSession` implementations given an identifier returned from this function.

getSeq-methods  

Retrieving a genome sequence

Description

Methods for retrieving the sequence of a `RangesList` from an object.

Methods

The following methods are defined by `rtracklayer` for `getSeq(object, range = range(object), ...)`.

- `object = "UCSCSession"` `getSeq(object, range = range(object), track = "Assembly")`: Gets the sequence in `range` and `track` from the session.

See Also

`sequence<-` for storing sequences.

import.gff  

Importing tracks

Description

These are the functions for importing `RangedData` instances from connections or text.

Usage

`import.gff(con, version = c("1", "2", "3"), genome = "hg18")`
`import.gff1(con, ...)`
`import.gff2(con, ...)`
`import.gff3(con, ...)`
`import.bed(con, wig = FALSE, trackLine = !wig, genome = "hg18", ...)`
`import.wig(con, genome = "hg18", ...)`
`import.ucsc(con, subformat = c("auto", "gff1", "wig", "bed"), drop = FALSE, ...)"
import.gff

Arguments

con
The connection from which to receive the input.

version
The version of GFF ("1", "2" or "3").

genome
The genome to set on the imported track.

wig
Whether the BED lines are expected to be WIG formatted (not for public use).

trackLine
Whether the BED data has a track line (it normally does though track lines are not mandatory).

subformat
The expected subformat of the UCSC data. If "auto", automatic detection of the subformat is attempted.

drop
If TRUE and there is only one track in the UCSC data, return the track instead of a list.

... For import.gff1, import.gff2 and import.gff3: arguments to pass to import.gff. For import.bed and import.wig: arguments to pass to methods. For import.ucsc: arguments to pass on to import.subformat.

Value

An instance of RangedData or one of its subclasses, except for import.ucsc, which returns a RangedDataList instance, unless there is one track and the drop parameter is TRUE.

Author(s)

Michael Lawrence

See Also

import for the high-level interface to these routines.

Examples

# import a GFF V2 file
gff <- import.gff(system.file("tests", "v2.gff", package = "rtracklayer"), version = "2")
# or

gff <- import.gff2(system.file("tests", "v2.gff", package = "rtracklayer"))

# import a WIG file
wig <- import.wig(system.file("tests", "bed.wig", package = "rtracklayer"))
# or

wig <- import.ucsc(system.file("tests", "bed.wig", package = "rtracklayer"),
     subformat = "wig", drop = TRUE)
import

**Importing objects**

**Description**

Imports an object from a connection according to a specified format.

**Usage**

`import(con, format, text, ...)`

**Arguments**

- `con` The connection through which the data is received. If this is a character vector, it is assumed to be a filename.
- `format` The format in which to expect the input. If omitted and `con` is a filename, the format is taken from the file extension.
- `text` If `con` is missing, this can be a character vector directly providing the string data to import.
- `...` Arguments to pass to the format-specific import routines.

**Details**

This function delegates to a format-specific function named according to the scheme `import.format` where `format` is specified by the `format` parameter.

**Value**

The object parsed from the connection or text.

**Author(s)**

Michael Lawrence

**See Also**

`export` to do the reverse.

**Examples**

```r
track <- import(system.file("tests", "bed.wig", package = "rtracklayer"))
track <- import(system.file("tests", "v1.gff", package = "rtracklayer"), version = "1")
  # or
track <- import(system.file("tests", "v1.gff", package = "rtracklayer"), "gff1")
```
sequence<-methods  Load a sequence

Description
Methods for loading sequences.

Methods
No methods are defined by rtracklayer for the `sequence(object, ...) <- value`
generic.

track<-methods  Laying tracks

Description
Methods for loading `RangedData` instances (tracks) into genome browsers.

Usage
```r
## S4 replacement method for signature 'BrowserSession,
## RangedData':
track(object, name = deparse(substitute(track)), view = FALSE, ...) <- value
```

Arguments
- `object` A `BrowserSession` into which the track is loaded.
- `value` The track(s) to load.
- `name` The name(s) of the track(s) being loaded.
- `view` Whether to create a view of the track after loading it.
- `...` Arguments to pass on to methods.

Methods
The following methods are defined by rtracklayer. A browser session implementation must imple-
ment a method for either `RangedData` or `RangedDataList`. The base browserSession
class will delegate appropriately.

- `object = "BrowserSession", value = "RangedData"` Load this track into the session.
- `object = "BrowserSession", value = "RangedDataList"` Load all tracks into the session.
- `object = "UCSCSession", value = "RangedDataList"` `track(object, name = deparse(substitute(track)),
view = FALSE, format = "gff") <- value;` Load the tracks into the session us-
ing the specified format.

See Also
- `track` for getting a track from a session.
### Examples

```r
## Not run:
session <- browserSession()
track <- import(system.file("tests", "v1.gff", package = "rtracklayer"))
track(session, "My Track") <- track
## End(Not run)
```

---

### Description

The `rtracklayer` package adds convenience methods on top of `RangedData` to manipulate data on genomic ranges. The spaces are now called chromosomes (but could still refer to some other type of sequence). The universe refers to the genome and there is formal treatment of an optional `strand` variable.

### Accessors

In the code snippets below, `x` is a `RangedData` object.

- `chrom(x)`: Gets the chromosome names (a factor) over the ranges in `x`.
- `genome(x), genome(x) <- value`: Gets or sets the genome (a single string or NULL) for the ranges in `x`; simple wrappers around `universe` and `universe<-`, respectively.
- `strand(x)`: Gets the strand factor in `x`, with the standard levels: `-`, `+` and `*`, referring to the negative, positive and either/both strands, respectively. Any strand factor stored in the `RangedData` should have those levels. NA's are allowed; the value is all NA if no strand has been specified.
- `score(x)`: gets the column representing a "score" in `x`, as a vector. This is the column named `score`, or, if this does not exist, the first column, if it is numeric. Otherwise, NULL is returned.
- `score(x) <- value`: sets the column named `score` to `value`, which should be a numeric vector of length equal to the number of rows.

### Constructor

```r
GenomicData(ranges, ..., strand = NULL, chrom = NULL, genome = NULL):
  Constructs a `RangedData` instance with the given ranges and variables in ...
  (see the `RangedData` constructor). If non-NULL, `strand` specifies the strand of each range. It should be a character vector or factor of length equal to that of `ranges`. All values should be either `-`, `+`, `*` or NA. To get these levels, call `levels(strand())`. `chrom` is analogous to `splitter` in `RangedData`; if non-NULL it should be coercible to a factor indicating how the ranges, variables and strand should be split up across the chromosomes. The `genome` argument should be a scalar string and is treated as the `RangedData` universe. See the examples.
```

### Author(s)

Michael Lawrence
Examples

```r
rangel1 <- IRanges(start=c(1,2,3), end=c(5,2,8))

## just ranges
gr <- GenomicData(rangel1)

## with a genome (universe)
gr <- GenomicData(rangel1, genome = "hg18")
genome(gr) ## "hg18"

## with some data
filter <- c(1L, 0L, 1L)
score <- c(10L, 2L, NA)
strand <- factor(c("+", NA, "-"), levels = levels(strand()))
gr <- GenomicData(rangel1, score, genome = "hg18")
gr["score"]
strand(gr) ## all NA
gr <- GenomicData(rangel1, score, filt = filter, strand = strand)
gr["filt"]
strand(gr) ## equal to 'strand'

range2 <- IRanges(start=c(15,45,20,1), end=c(15,100,80,5))
ranges <- c(rangel1, range2)
score <- c(score, c(0L, 3L, NA, 22L))
chrom <- paste("chr", rep(c(1,2), c(length(rangel1), length(range2))), sep="")
gr <- GenomicData(ranges, score, chrom = chrom, genome = "hg18")
chrom(gr) # equal to 'chrom'

gr[1]["score"] # equal to score[1:3]
```

RangesList-methods  Ranges on a Genome

Description

Genomic coordinates are often specified in terms of a genome identifier, chromosome name, start position and end position. This information can be represented by a RangesList instance, and the rtracklayer package adds convenience methods to RangesList for the manipulation of genomic ranges. The spaces (or names) of RangesList are the chromosome names. The universe slot indicates the genome, usually as given by UCSC (e.g. "hg18").

Accessors

In the code snippets below, x is a RangesList object.

- `chrom(x)`: Gets the chromosome names (a factor) over the ranges in x.
- `genome(x), genome(x) <- value`: Gets or sets the genome (a single string or NULL) for the ranges in x; simple wrappers around `universe` and `universe<-`, respectively.
Constructor

`GenomicRanges(start, end, chrom = NULL, genome = NULL)`: Constructs a `RangesList` containing ranges specified by `start` and `end`, optionally split into elements based on `chrom`, a vector of chromosome identifiers (or `NULL` for no splitting). The `genome` argument should be a scalar string and is treated as the `RangesList` universe. See the examples.

Author(s)

Michael Lawrence

Examples

```r
GenomicRanges(c(1,2,3), c(5,2,8))
GenomicRanges(c(1,2,3), c(5,2,8), c("chr1", "chr1", "chr2"))
GenomicRanges(c(1,2,3), c(5,2,8), genome = "hg18")
```

---

targets  
---

microRNA target sites

Description

A data frame of human microRNA target sites retrieved from MiRBase. This is a subset of the `hsTargets` data frame in the `microRNA` package. See the `rtracklayer` vignette for more details.

Usage

`data(targets)`

Format

A data frame with 2981 observations on the following 6 variables.

- `name` The miRBase ID of the microRNA.
- `target` The Ensembl ID of the targeted transcript.
- `chrom` The name of the chromosome for target site.
- `start` Target start position.
- `end` Target stop position.
- `strand` The strand of the target site, "+", or "-".

Source

The `microRNA` package, dataset `hsTargets`. Originally MiRBase (http://microrna.sanger.ac.uk/).

Examples

```r
data(targets)
targetTrack <- with(targets,
  GenomicData(IRanges(start, end),
  strand = strand, chrom = chrom))
```
tracks-methods

Tracking methods

Accessing track names

Description

Methods for getting and setting track names.

Methods

The following methods are defined by `rtracklayer` for getting track names via the generic `trackNames(object, ...)`.

Get the tracks loaded in the session.

```r
object = "UCSCSession"
```

Get the visible tracks according to the modes (all tracks not set to "hide").

```r
object = "UCSCTrackModes"
```

Get the visible tracks in the view.

```r
object = "UCSCView"
```

The following methods are defined by `rtracklayer` for setting track names via the generic `trackNames(object) <- value`.

Sets the tracks that should be visible in the modes. All specified tracks with mode "hide" in `object` are set to mode "full". Any tracks in `object` that are not specified in the value are set to "hide". No other modes are changed.

```r
object = "UCSCTrackModes"
```

Sets the visible tracks in the view. This opens a new web browser with only the specified tracks visible.

```r
object = "UCSCView"
```

UCSCData-class

Class "UCSCData"

Description

Each track in UCSC has an associated `TrackLine` that contains metadata on the track.

Slots

- **trackLine**: Object of class "TrackLine" holding track metadata.
- **genome**: Object of class "character" identifying the genome of this track, e.g. "hg18".
- **assayData**: Object of class "AssayData" holding the experimental measurements under `dataVals`.
- **phenoData**: Object of class "AnnotatedDataFrame" holding the experimental design matrix.
- **featureData**: Object of class "AnnotatedDataFrame" holding feature information, generally including columns `chrom` (chromosome), `start` (start position), `end` (end position) and `strand` (strand on the DNA: "+", ",", or NA).
- **experimentData**: Object of class "MIAME" holding experimental metadata.
- **annotation**: Object of class "character" referring to the annotation dataset.
- **__classVersion__**: Object of class "Versions" holding version information.
Methods

`export.bed(object, con, wig = FALSE, trackLine = !wig)` Exports the track and its track line (if `trackLine` is TRUE) to `con` in the Browser Extended Display (BED) format.

`export.gff(object)` Exports the track and its track line (as a comment) to `con` in the General Feature Format (GFF).

`export.ucsc(object)` Exports the track and its track line to `con` in the UCSC meta-format.

`as(object, "UCSCData")` Constructs a UCSCData from a RangedData instance, by adding a default track line and ensuring that the sequence/chromosome names are compliant with UCSC conventions.

Author(s)

Michael Lawrence

See Also

import and export for reading and writing tracks to and from connections (files), respectively.

UCSCSession-class  Class "UCSCSession"

Description

An implementation of BrowserSession for the UCSC genome browser.

Objects from the Class

Objects can be created by calls of the form `browserSession("ucsc", url = "http://genome.ucsc.edu", ..., )`. The arguments in ... correspond to libcurl options, see getCurlHandle. Setting these options may be useful e.g. for getting past a proxy.

Slots

`url`: Object of class "character" holding the base URL of the UCSC browser.

`hguid`: Object of class "numeric" holding the user identification code.

`views`: Object of class "environment" containing a list stored under the name "instances". The list holds the instances of BrowserView for this session.

Extends

Class "BrowserSession", directly.
**UCSCTableQuery-class**

**Methods**

```r
browserView(object, range = range(object), track = trackNames(object), ...)  
Creates a BrowserView of range with visible tracks specified by track. track may be  
an instance of UCSCTrackModes. Arguments in ... should override slots in range or  
else match parameters to a ucscTrackModes method for creating a UCSCTrackModes  
instance that will override modes indicated by the track parameter.
```

```r
browserViews(object)  
Gets the BrowserView instances for this session.
```

```r
range(x)  
Gets the RangesList last displayed in this session.
```

```r
genome(x)  
Gets the genome identifier of the session, i.e. genome(range(x)).
```

```r
range(x) <- value  
Sets value, a RangesList, as the range of session x. Note that this  
setting only lasts until a view is created or manipulated. This mechanism is useful, for exam-  
ple, when treating the UCSC browser as a database, rather than a genome viewer.
```

```r
genome(x) <- value  
Sets the genome identifier on the range of session x.
```

```r
getSeq(object, range, track = "Assembly")  
Gets the sequence in range and track.
```

```r
track(object, name = names(track), view = TRUE, format = "gff", ...) <- value  
Loads a track, stored under name and formatted as format. The arguments in ... are  
passed on to export.ucsc, so they could be slots in a TrackLine subclass or parameters  
to pass on to the export function for format.
```

```r
track(object, name, range = range(object), table = NULL)  
Retrieves a RangedData  
with features in range from track named name. Some built-in tracks have multiple series,  
each stored in a separate database table. A specific table may be retrieved by passing its name  
in the table parameter. See tableNames for a way to list the available tables.
```

```r
trackNames(object)  
Gets the names of the tracks stored in the session.
```

```r
ucscTrackModes(object)  
Gets the default view modes for the tracks in the session.
```

**UCSCTableQuery-class**

Querying UCSC Tables

**Description**

The UCSC genome browser is backed by a large database, which is exposed by the Table Browser  
web interface. Tracks are stored as tables, so this is also the mechanism for retrieving tracks. The  
UCSCTableQuery class represents a query against the Table Browser. Storing the query fields in  
a formal class facilitates incremental construction and adjustment of a query.
Details

There are four supported fields for a table query:

- **session** The UCSCSession instance from the tables are retrieved. Although all sessions are based on the same database, the set of user-uploaded tracks, which are represented as tables, is not the same, in general.

- **trackName** The name of a track from which to retrieve a table. Each track can have multiple tables. Many times there is a primary table that is used to display the track, while the other tables are supplemental. Sometimes, tracks are displayed by aggregating multiple tables.

- **tableName** The name of the specific table to retrieve. May be NULL, in which case the behavior depends on how the query is executed, see below.

- **range** A RangesList indicating the portion of the table to retrieve, in genome coordinates. The genome indicated by the RangesList also determines which tracks are available and must always be non-NULL. If the RangesList is empty, the table is downloaded for the entire genome.

A common workflow for querying the UCSC database is to create an instance of UCSCTableQuery using the ucscTableQuery constructor, invoke tableNames to list the available tables for a track, and finally to retrieve the desired table either as a data.frame via `getTable` or as a RangedData track via `track`. See the examples.

The reason for a formal query class is to facilitate multiple queries when the differences between the queries are small. For example, one might want to query multiple tables within the track and/or same genomic region, or query the same table for multiple regions. The UCSCTableQuery instance can be incrementally adjusted for each new query. Some caching is also performed, which enhances performance.

Constructor

```r
ucscTableQuery(x, track, range = GenomicRanges(), table = NULL)
```

Creates a UCSCTableQuery with the UCSCSession given as `x` and the track name given by the single string `track`. `range` should be a RangesList instance, and it effectively defaults to `range(x)`. Any missing information in `range`, often the genome identifier, is filled in from `range(x)`. The table name is given by `table`, which may be a single string or NULL.

Executing Queries

Below, `object` is a UCSCTableQuery instance.

- **track(object)**: Retrieves the indicated table as a track, i.e. a RangedData instance. Note that not all tables are available as tracks.

- **getTable(object)**: Retrieves the indicated table as a data.frame. Note that not all tables are output in parseable form.

- **tableNames(object)**: Gets the names of the tables available for the session, track and range specified by the query.

Accessor methods

In the code snippets below, `x/object` is a UCSCTableQuery object.

- **browserSession(object), browserSession(object) <- value**: Get or set the UCSCSession to query.
TrackLine-class

trackName(x),trackName(x) <- value: Get or set the single string indicating the track containing the table of interest.

tableName(x),tableName(x) <- value: Get or set the single string indicating the name of the table to retrieve. May be NULL, in which case the table is automatically determined.

description(x),range(x) <- value: Get or set the RangesList indicating the portion of the table to retrieve in genomic coordinates. Any missing information, such as the genome identifier, is filled in using range(browserSession(x)).

Author(s)

Michael Lawrence

Examples

## Not run:
session <- browserSession()
genome(session) <- "mm9"
trackNames(session) ## list the track names
## choose the Conservation track for a portion of mm9 chr1
query <- ucscTableQuery(session, "Conservation",
                          GenomicRanges(57795963, 57815592, "chr12"))
## list the table names
tableNames(query)
## get the phastCons30way track
tableName(query) <- "phastCons30way"
## retrieve the track data
track(query)
## get a data.frame summarizing the multiple alignment
tableName(query) <- "multiz30waySummary"
getTable(query)
## End(Not run)

TrackLine-class

Class "TrackLine"

Description

An object representing a "track line" in the UCSC format. There are two concrete types of track lines: BasicTrackLine (used for most types of tracks) and WigTrackLine (used for Wiggle tracks). This class only declares the common elements between the two.

Objects from the Class

Objects can be created by calls of the form new("TrackLine", ...) or parsed from a character vector track line with as(text, "TrackLine"). But note that UCSC only understands one of the subclasses mentioned above.

Slots

name: Object of class "character" specifying the name of the track.
description: Object of class "character" describing the track.
visibility: Object of class "character" indicating the default visible mode of the track, see UCSCTrackModes.

color: Object of class "integer" representing the track color (as from col2rgb).

priority: Object of class "numeric" specifying the rank of this track.

Methods

as(object, "character") Export line to its string representation.

Author(s)

Michael Lawrence

References

http://genome.ucsc.edu/goldenPath/help/customTrack.html#TRACK for the official documentation.

See Also

BasicTrackLine (used for most types of tracks) and WigTrackLine (used for Wiggle tracks).
Methods

trackNames(object) Gets the names of the visible tracks (those that do not have mode "hide").

trackNames(object) <- value Sets the names of the visible tracks. Any tracks named in value are set to "full" if the are currently set to "hide" in this object. Any tracks not in value are set to "hide". All other modes are preserved.

object[i] Gets the track mode of the tracks indexed by i, which can be any type of index supported by character vector subsetting. If i is a character vector, it indexes first by the internal track IDs (the names on .Data) and then by the user-level track names (the labels slot).

object[i] <- value Sets the track modes indexed by i (in the same way as in object[i] above) to those specified in value.

Author(s)

Michael Lawrence

UCSCView on which track view modes may be set.

ucscTrackModes-methods

Accessing UCSC track modes

Description

Generics for getting and setting UCSC track visibility modes ("hide", "dense", "full", "pack", "squish").

Methods

The following methods are defined by rtracklayer for getting the track modes through the generic ucscTrackModes(object, ...).

function(object, hide = character(), dense = character(), pack = character(), squish = character(), full = character()) Creates an instance of UCSTrackModes from object, a character vector of mode names, with the corresponding track names given in the names attribute. Note that object can be a UCSTrackModes instance. The other parameters are character vectors naming the tracks for each mode and overriding the modes specified by object.

object = "character" object = "missing" The same interface as above, except object defaults to an empty character vector.

object = "UCSCView" Gets modes for tracks in the view.

object = "UCSCSession" Gets default modes for the tracks in the session. These are the modes that will be used as the default for a newly created view.

The following methods are defined by rtracklayer for setting the track modes through the generic ucscTrackModes(object) <- value.

object = "UCSCView", value = "UCSTrackModes" Sets the modes for the tracks in the view.

object = "UCSCView", value = "character" Sets the modes from a character vector of mode names, with the corresponding track names given in the names attribute.
See Also

trackNames and trackNames<- for just getting or setting which tracks are visible (not of mode "hide").

Examples

# Tracks "foo" and "bar" are fully shown, "baz" is hidden
modes <- ucscTrackModes(full = c("foo", "bar"), hide = "baz")
# Update the modes to hide track "bar"
modes2 <- ucscTrackModes(modes, hide = "bar")

Description

An object representing a view of a genome in the UCSC browser.

Objects from the Class

Objects are created by calling browserView(session, ...) where session is a UCSCSession.

Slots

hgsid: Object of class "numeric", which identifies this view to UCSC.

session: Object of class "BrowserSession" to which this view belongs.

Extends

Class "BrowserView", directly.

Methods

activeView(object) Obtains a logical indicating whether this view is the active view.

range(object) Obtains the RangesList displayed by this view.

range(object) <- value Sets the RangesList displayed by this view.

trackNames(object) Gets the names of the visible tracks in this view.

trackNames(object) <- value Sets the visible tracks by name.

visible(object) Get a named logical vector indicating whether each track is visible.

visible(object) <- value Set a logical vector indicating the visibility of each track, in the same order as returned by visible(object).

ucscTrackModes(object) Obtains the UCSCTrackModes for this view.

ucscTrackModes(object) <- value Sets the UCSCTrackModes for this view. The value may be either a UCSCTrackModes instance or a character vector that will be coerced by a call to ucscTrackModes.

`browserView` for creating instances of this class.

WigTrackLine-class  Class "WigTrackLine"

Description

A UCSC track line for Wiggle tracks.

Objects from the Class

Objects can be created by calls of the form `new("WigTrackLine", ...)` or parsed from a character vector track line with `as(text, "WigTrackLine")` or converted from a `BasicTrackLine` using `as(basic, "WigTrackLine")`.

Slots

- `altColor`: Object of class "integer" giving an alternate color, as from `col2rgb`.
- `autoScale`: Object of class "logical" indicating whether to automatically scale to min/max of the data.
- `gridDefault`: Object of class "logical" indicating whether a grid should be drawn.
- `maxHeightPixels`: Object of class "numeric" of length three (max, default, min), giving the allowable range for the vertical height of the graph.
- `graphType`: Object of class "character", specifying the graph type, either "bar" or "points".
- `viewLimits`: Object of class "numeric" and of length two specifying the data range (min, max) shown in the graph.
- `yLineMark`: Object of class "numeric" giving the position of a horizontal line.
- `yLineOnOff`: Object of class "logical" indicating whether the `yLineMark` should be visible.
- `windowingFunction`: Object of class "character", one of "maximum", "mean", "minimum", for removing points when the graph shrinks.
- `smoothingWindow`: Object of class "numeric" giving the window size of a smoother to pass over the graph.
- `name`: Object of class "character" specifying the name of the track.
- `description`: Object of class "character" describing the track.
- `visibility`: Object of class "character" indicating the default visible mode of the track, see `UCSCTrackModes`.
- `color`: Object of class "integer" representing the track color (as from `col2rgb`).
- `priority`: Object of class "numeric" specifying the rank of this track.

Extends

Class "TrackLine", directly.
Methods

as(object, "character") Export line to its string representation.

as(object, "BasicTrackLine") Convert this line to a basic UCSC track line, using defaults for slots not held in common.
