

# Package ‘GeoTcgaData’

April 24, 2024

**Type** Package

**Title** Processing Various Types of Data on GEO and TCGA

**Version** 2.3.1

**Description** Gene Expression Omnibus(GEO) and The Cancer Genome Atlas (TCGA) provide us with a wealth of data, such as RNA-seq, DNA Methylation, SNP and Copy number variation data. It's easy to download data from TCGA using the gdc tool, but processing these data into a format suitable for bioinformatics analysis requires more work. This R package was developed to handle these data.

**Depends** R (>= 4.2.0)

**License** Artistic-2.0

**Encoding** UTF-8

**RoxygenNote** 7.2.3

**Suggests** knitr, rmarkdown, DESeq2, S4Vectors, ChAMP, impute, tidyr, clusterProfiler, org.Hs.eg.db, edgeR, limma, quantreg, minfi, IlluminaHumanMethylation450kanno.ilmn12.hg19, dearseq, NOISeq, testthat (>= 3.0.0), CATT, TCGAbiolinks, enrichplot, GEOquery, BiocGenerics

**VignetteBuilder** knitr

**Imports** utils, data.table, plyr, cqn, topconfects, stats, SummarizedExperiment, methods

**Language** en-US

**URL** <https://github.com/YuLab-SMU/GeoTcgaData>

**BugReports** <https://github.com/YuLab-SMU/GeoTcgaData/issues>

**biocViews** GeneExpression, DifferentialExpression, RNASeq, CopyNumberVariation, Microarray, Software, DNAMethylation, DifferentialMethylation, SNP, ATACSeq, MethylationArray

**Config/testthat/edition** 3

**git\_url** <https://git.bioconductor.org/packages/GeoTcgaData>

**git\_branch** devel

**git\_last\_commit** a193e0b

**git\_last\_commit\_date** 2024-03-17  
**Repository** Bioconductor 3.19  
**Date/Publication** 2024-04-24  
**Author** Erqiang Hu [aut, cre] (<<https://orcid.org/0000-0002-1798-7513>>)  
**Maintainer** Erqiang Hu <13766876214@163.com>

array_preprocess	<i>Preprocess of Microarray data</i>
------------------	--------------------------------------

---

**Description**

Preprocess of Microarray data

**Usage**

```
array_preprocess(x, missing_value = "knn", string = " /// ")
```

**Arguments**

x	matrix of Microarray data, each column is a sample, and each row is a gene.
missing_value	Method to impute missing expression data, one of "zero" and "knn".
string	a string, sep of the gene

**Value**

matrix

**Examples**

```
arraylist <- get_geo_array("GSE781")  
arraylist <- lapply(arraylist, array_preprocess)
```

---

cal_mean_module	<i>Find the mean value of the gene in each module</i>
-----------------	---

---

**Description**

Find the mean value of the gene in each module

**Usage**

```
cal_mean_module(geneExpress, module)
```

**Arguments**

geneExpress	a data.frame of gene expression data. Each column is a sample, and each row is a gene.
module	a data.frame of two column. The first column is module name, the second column are genes in this module.

**Value**

a data.frame, means the mean of gene expression value in the same module

**Examples**

```
data(geneExpress)
data(module)
result <- cal_mean_module(geneExpress, module)
```

---

cluster_array	<i>cluster probes of Microarray data</i>
---------------	--

---

**Description**

cluster probes of Microarray data

**Usage**

```
cluster_array(x, clusterCutoff = 0.7)
```

**Arguments**

x	matrix of Microarray data, the first is the name of the gene, and the others are the expression value.
clusterCutoff	Pearson correlation threshold to cut off the hierarchical tree.

**Value**

data.frame

**Examples**

```
arraylist <- get_geo_array("GSE781")
arraylist <- lapply(arraylist, array_preprocess)
arraylist_cluster <- lapply(arraylist, cluster_array)
```

---

combine_pvalue	<i>combine pvalues of SNP difference analysis result</i>
----------------	--

---

**Description**

combine pvalues of SNP difference analysis result

**Usage**

```
combine_pvalue(snpResult, snp2gene, combineMethod = min)
```

**Arguments**

snpResult	data.frame of SNP difference analysis result.
snp2gene	data frame of two column: snp and gene.
combineMethod	Method of combining the pvalue of multiple snp in a gene.

**Value**

data.frame

**Examples**

```
snpResult <- data.frame(pvalue = runif(100), estimate = runif(100))
rownames(snpResult) <- paste0("snp", seq_len(100))
snp2gene <- data.frame(snp = rownames(snpResult),
  gene = rep(paste0("gene", seq_len(20)), 5))
result <- combine_pvalue(snpResult, snp2gene)
```

---

countToFpkm	<i>Convert count to FPKM</i>
-------------	------------------------------

---

**Description**

Convert count to FPKM

**Usage**

```
countToFpkm(counts_matrix, keyType = "SYMBOL", gene_cov)
```

**Arguments**

counts_matrix	a matrix, colnames of counts_matrix are sample name, rownames of counts_matrix are gene symbols
keyType	keyType, one of keytypes(org.Hs.eg.db).
gene_cov	data.frame of two column, the first column is gene length, the second column is gene GC content

Value

a matrix

Examples

```
data(gene_cov)
lung_squ_count2 <- matrix(c(1, 2, 3, 4, 5, 6, 7, 8, 9), ncol = 3)
rownames(lung_squ_count2) <- c("DISC1", "TCOF1", "SPPL3")
colnames(lung_squ_count2) <- c("sample1", "sample2", "sample3")
result <- countToFpm(lung_squ_count2,
  keyType = "SYMBOL",
  gene_cov = gene_cov
)
```

---

countToTpm	<i>Convert count to Tpm</i>
------------	-----------------------------

---

Description

Convert count to Tpm

Usage

```
countToTpm(counts_matrix, keyType = "SYMBOL", gene_cov)
```

Arguments

- counts\_matrix    a matrix, colnames of counts\_matrix are sample name, rownames of counts\_matrix are gene symbols
- keyType            keyType, one of keytypes(org.Hs.eg.db).
- gene\_cov           data.frame of two column, the first column is gene length, the second column is gene GC content

Value

a matrix

Examples

```
data(gene_cov)
lung_squ_count2 <- matrix(c(1, 2, 3, 4, 5, 6, 7, 8, 9), ncol = 3)
rownames(lung_squ_count2) <- c("DISC1", "TCOF1", "SPPL3")
colnames(lung_squ_count2) <- c("sample1", "sample2", "sample3")
result <- countToTpm(lung_squ_count2,
  keyType = "SYMBOL",
  gene_cov = gene_cov
)
```

---

differential\_array      *Differential analysis of Microarray data*

---

**Description**

Differential analysis of Microarray data

**Usage**

```
differential_array(df, group, method = "limma", adjust.method = "BH")
```

**Arguments**

df	data.frame of the omic data, each column is a sample, and each row is a gene.
group	a vector, group of samples.
method	method to do differential analysis, one of "limma", "ttest", "wilcox".
adjust.method	adjust.method, one of "holm", "hochberg", "hommel", "bonferroni", "BH", "BY", "fdr", and "none".

**Value**

data.frame

**Examples**

```
library(GeoTcgaData)
library(data.table)
# Use real GEO data as example
arrayData <- read.table("GSE54807_series_matrix.txt.gz",
  sep = "\t", header = TRUE,
  fill=TRUE, comment.char = "!", check.names=FALSE)
gpl <- fread("GPL6244-17930.txt", sep = "\t", header = TRUE)
gpl <- gpl[, c("ID", "gene_assignment")]
class(gpl) <- "data.frame"

for (i in seq_len(nrow(gpl))) {
  aa <- strsplit(gpl[i, 2], " // ")[[1]][5]
  gpl[i, 2] <- as.character(strsplit(aa, " /// ")[[1]][1])
}
gpl[,1] <- as.character(gpl[,1])
arrayData[, 1] <- as.character(arrayData[, 1])
rownames(gpl) <- gpl[, 1]
arrayData[, 1] <- gpl[arrayData[, 1], 2]

arrayData <- repRemove(arrayData," /// ")

# Remove rows that do not correspond to genes
```

```

arrayData <- arrayData[!is.na(arrayData[, 1]), ]
arrayData <- arrayData[!arrayData[, 1] == "", ]
arrayData <- arrayData[!arrayData[, 1] == "---", ]

arrayData <- arrayData[order(arrayData[, 1]), ]
arrayData <- gene_ave(arrayData, 1)

keep <- apply(arrayData, 1, function(x) sum(x < 1) < (length(x)/2))
arrayData <- arrayData[keep, ]

group <- c(rep("group1", 12), rep("group2", 12))
result <- differential_array(df = arrayData, group = group)

# Use random data as example
arrayData <- matrix(runif(200), 25, 8)
rownames(arrayData) <- paste0("gene", 1:25)
colnames(arrayData) <- paste0("sample", 1:8)
group <- c(rep("group1", 4), rep("group2", 4))
names(group) <- colnames(arrayData)
result <- differential_array(df = arrayData, group = group)

```

---

differential\_CNV

*Do difference analysis of gene level copy number variation data*

---

## Description

Do difference analysis of gene level copy number variation data

## Usage

```

differential_CNV(
  cnvData,
  sampleGroup,
  method = "Chisquare",
  adjust.method = "BH",
  ...
)

```

## Arguments

cnvData	data.frame of CNV data, each column is a sample, and each row is a CNV.
sampleGroup	vector of sample group
method	method to do diffenental analysis, one of "Chisquare", "fisher", and "CATT"(Cochran-Armitage trend test)
adjust.method	adjust.method, one of "holm", "hochberg", "hommel", "bonferroni", "BH", "BY", "fdr", and "none".
...	parameters for "Chisquare", "fisher", and "CATT"(Cochran-Armitage trend test)

**Value**

data.frame with pvalue and estimate

**Examples**

```
# use TCGAbiolinks data as example
library(TCGAbiolinks)
query <- GDCquery(
  project = "TCGA-ACC",
  data.category = "Copy Number Variation",
  data.type = "Gene Level Copy Number",
  access = "open"
)
GDCdownload(query)
cnvData <- GDCprepare(query)
aa <- assays(cnvData)$copy_number
bb <- aa
aa[bb == 2] <- 0
aa[bb < 2] <- -1
aa[bb > 2] <- 1
sampleGroup <- sample(c("A", "B"), ncol(cnvData), replace = TRUE)
diffCnv <- differential_CNV(aa, sampleGroup)

# Use sangerbox CNV data as example
cnvData <- fread("Merge_GeneLevelCopyNumber.txt")
class(cnvData) <- "data.frame"
rownames(cnvData) <- cnvData[, 1]
cnvData <- cnvData[, -c(1, 2, 3)]
sampleGroup <- sample(c("A", "B"), ncol(cnvData), replace = TRUE)
diffCnv <- differential_CNV(cnvData, sampleGroup)

# use random data as example
aa <- matrix(sample(c(0, 1, -1), 200, replace = TRUE), 25, 8)
rownames(aa) <- paste0("gene", 1:25)
colnames(aa) <- paste0("sample", 1:8)
sampleGroup <- sample(c("A", "B"), ncol(aa), replace = TRUE)
diffCnv <- differential_CNV(aa, sampleGroup)
```

---

differential\_limma      *differential\_limma*

---

**Description**

differential\_limma

**Usage**

```
differential_limma(df, group, adjust.method = "BH")
```

**Arguments**

df                      data.frame of the omic data

group                  a vector, group of samples.

adjust.method        adjust.method.

**Value**

data.frame

**Examples**

```
df <- matrix(runif(200), 25, 8)
df <- as.data.frame(df)
rownames(df) <- paste0("gene", 1:25)
colnames(df) <- paste0("sample", 1:8)
group <- sample(c("group1", "group2"), 8, replace = TRUE)
result <- differential_limma(df = df, group = group)
```

---

differential\_methy      *differential\_methy*

---

**Description**

Get methylation difference gene

**Usage**

```
differential_methy(
  cpaData,
  sampleGroup,
  groupCol,
  combineMethod = "stouffer",
  missing_value = "knn",
  cpG2gene = NULL,
  normMethod = "PBC",
  region = "TSS1500",
  model = "gene",
  adjust.method = "BH",
  adjPvalCutoff = 0.05,
  ucscData = FALSE
)
```

**Arguments**

<code>cpaData</code>	data.frame of cpg beta value, , or SummarizedExperiment object
<code>sampleGroup</code>	vector of sample group
<code>groupCol</code>	group column
<code>combineMethod</code>	method to combine the cpg pvalues, a function or one of "stouffer", "fisher" and "rhoScores".
<code>missing_value</code>	Method to impute missing expression data, one of "zero" and "knn".
<code>cpa2gene</code>	data.frame to annotate cpg locus to gene
<code>normMethod</code>	Method to do normalization: "PBC" or "BMIQ".
<code>region</code>	region of genes, one of "Body", "TSS1500", "TSS200", "3'UTR", "1stExon", "5'UTR", and "IGR". Only used when <code>cpa2gene</code> is NULL.
<code>model</code>	if "cpg", step1: calculate difference cpgs; step2: calculate difference genes. if "gene", step1: calculate the methylation level of genes; step2: calculate difference genes.
<code>adjust.method</code>	character string specifying the method used to adjust p-values for multiple testing. See <a href="#">p.adjust</a> for possible values.
<code>adjPvalCutoff</code>	adjusted pvalue cutoff
<code>ucscData</code>	Logical, whether the data comes from UCSC Xena.

**Value**

data.frame

**Examples**

```
# use TCGAbiolinks data
library(TCGAbiolinks)
query <- GDCquery(project = "TCGA-ACC",
  data.category = "DNA Methylation",
  data.type = "Methylation Beta Value",
  platform = "Illumina Human Methylation 450")
GDCdownload(query, method = "api", files.per.chunk = 5,
  directory = Your_Path)
merge_result <- Merge_methy_tcga(Your_Path_to_DNA_Methylation_data)
library(ChAMP) # To avoid reporting errors
differential_gene <- differential_methy(cpaData = merge_result,
  sampleGroup = sample(c("C","T"),
  ncol(merge_result[[1]]), replace = TRUE))

# use user defined data
library(ChAMP)
cpaData <- matrix(runif(2000), nrow = 200, ncol = 10)
rownames(cpaData) <- paste0("cpg", seq_len(200))
colnames(cpaData) <- paste0("sample", seq_len(10))
sampleGroup <- c(rep("group1", 5), rep("group2", 5))
names(sampleGroup) <- colnames(cpaData)
cpa2gene <- data.frame(cpg = rownames(cpaData),
```

```

    gene = rep(paste0("gene", seq_len(20)), 10))
result <- differential_methy(cpgData, sampleGroup,
    cpg2gene = cpg2gene, normMethod = NULL)
# use SummarizedExperiment object input
library(ChAMP)
cpgData <- matrix(runif(2000), nrow = 200, ncol = 10)
rownames(cpgData) <- paste0("cpg", seq_len(200))
colnames(cpgData) <- paste0("sample", seq_len(10))
sampleGroup <- c(rep("group1", 5), rep("group2", 5))
names(sampleGroup) <- colnames(cpgData)
cpg2gene <- data.frame(cpg = rownames(cpgData),
    gene = rep(paste0("gene", seq_len(20)), 10))
colData <- S4Vectors::DataFrame(
    row.names = colnames(cpgData),
    group = sampleGroup
)
data <- SummarizedExperiment::SummarizedExperiment(
    assays=S4Vectors::SimpleList(counts=cpgData),
    colData = colData)
result <- differential_methy(cpgData = data,
    groupCol = "group", normMethod = NULL,
    cpg2gene = cpg2gene)

```

---

differential_RNA	<i>differential_RNA</i>
------------------	-------------------------

---

## Description

Do difference analysis of RNA-seq data

## Usage

```

differential_RNA(
  counts,
  group,
  groupCol,
  method = "limma",
  geneLength = NULL,
  gccontent = NULL,
  filter = TRUE,
  edgeRNorm = TRUE,
  adjust.method = "BH",
  useTopconfects = TRUE,
  ucscData = FALSE
)

```

**Arguments**

counts	a dataframe or numeric matrix of raw counts data, or SummarizedExperiment object
group	sample groups
groupCol	group column
method	one of "DESeq2", "edgeR" , "limma", "dearseq", "NOISeq", "Wilcoxon", and "auto".
geneLength	a vector of gene length.
gccontent	a vector of gene GC content.
filter	if TRUE, use filterByExpr to filter genes.
edgeRNorm	if TRUE, use edgeR to do normalization for dearseq method.
adjust.method	character string specifying the method used to adjust p-values for multiple testing. See <a href="#">p.adjust</a> for possible values.
useTopconfects	if TRUE, use topconfects to provide a more biologically useful ranked gene list.
ucscData	Logical, whether the data comes from UCSC Xena.

**Value**

data.frame

**Examples**

```
library(TCGAbiolinks)

query <- GDCquery(
  project = "TCGA-ACC",
  data.category = "Transcriptome Profiling",
  data.type = "Gene Expression Quantification",
  workflow.type = "STAR - Counts"
)

GDCdownload(query,
  method = "api", files.per.chunk = 3,

```

---

differential_SNP	<i>Do difference analysis of SNP data</i>
------------------	---

---

## Description

Do difference analysis of SNP data

## Usage

```
differential_SNP(snpDf, sampleGroup, combineMethod = min)
```

## Arguments

snpDf	data.frame of SNP data, each column is a sample, and each row is a SNP.
sampleGroup	vector of sample group.
combineMethod	Method of combining the pvalue of multiple snp in a gene.

## Value

data.frame

## Examples

```
library(TCGAbiolinks)
query <- GDCquery(
  project = "TCGA-CHOL",
  data.category = "Simple Nucleotide Variation",
  access = "open",
  legacy = FALSE,
  data.type = "Masked Somatic Mutation",
  workflow.type = "Aliquot Ensemble Somatic Variant Merging and Masking"
)
GDCdownload(query)

snpDf <- as.data.frame(snpDf)
sampleGroup <- sample(c("A", "B"), 10, replace = TRUE)
result <- differential_SNP(snpDf, sampleGroup)

```

---

differential\_SNP\_GEO    *Do difference analysis of SNP data downloaded from GEO*

---

## Description

Do difference analysis of SNP data downloaded from GEO

## Usage

```
differential_SNP_GEO(snpData, sampleGroup, method = "Chisquare")
```

## Arguments

snpData	data.frame of SNP data downloaded from GEO
sampleGroup	vector of sample group
method	one of "Chisquare", "fisher", and "CATT"(Cochran-Armitage trend test)

## Value

data.frame

## Examples

```

file1 <- read.table("GSE66903_series_matrix.txt.gz",
  fill=TRUE, comment.char="!", header = TRUE)
rownames(file1) <- file1[, 1]
snpData <- file1[, -1]
sampleGroup <- sample(c("A", "B"), ncol(snpData ), replace = TRUE)
names(sampleGroup) <- colnames(snpData)
snpData <- SNP_QC(snpData)
sampleGroup <- sample(c("A", "B"), ncol(snpData ), replace = TRUE)
result1 <- differential_SNP_GEO(snpData = snpData,
  sampleGroup = sampleGroup, method = "Chisquare")

result <- differential_SNP_GEO(snpDf, sampleGroup, method = "fisher")

```

---

differential\_SNP\_tcga *Do difference analysis of SNP data downloaded from TCGAbiolinks*

---

## Description

Do difference analysis of SNP data downloaded from TCGAbiolinks

## Usage

```
differential_SNP_tcga(snpData, sampleGroup, combineMethod = NULL)
```

## Arguments

snpData	data.frame of SNP data downloaded from TCGAbiolinks
sampleGroup	vector of sample group
combineMethod	Method of combining the pvalue of multiple snp in a gene.

## Value

data.frame

## Examples

```
library(TCGAbiolinks)
query <- GDCquery(
  project = "TCGA-CHOL",
  data.category = "Simple Nucleotide Variation",
  access = "open",
  legacy = FALSE,

snpDf <- matrix(sample(c("mutation", NA), 100, replace = TRUE), 10, 10)
snpDf <- as.data.frame(snpDf)
sampleGroup <- sample(c("A", "B"), 10, replace = TRUE)
result <- differential_SNP(snpDf, sampleGroup)
```

---

**fpkmToTpm***Convert fpkm to Tpm*

---

**Description**

Convert fpkm to Tpm

**Usage**

```
fpkmToTpm(fpkm_matrix)
```

**Arguments**

**fpkm\_matrix**      a matrix, colnames of fpkm\_matrix are sample name, rownames of fpkm\_matrix are genes

**Value**

a matrix

**Examples**

```
lung_squ_count2 <- matrix(c(0.11, 0.22, 0.43, 0.14, 0.875,  
  0.66, 0.77, 0.18, 0.29), ncol = 3)  
rownames(lung_squ_count2) <- c("DISC1", "TCOF1", "SPPL3")  
colnames(lung_squ_count2) <- c("sample1", "sample2", "sample3")  
result <- fpkmToTpm(lung_squ_count2)
```

---

**geneExpress***a data.frame of gene expression data*

---

**Description**

It is a randomly generated expression data used as an example of functions in this package. the rowname is gene symbols the columns are gene expression values

**Usage**

```
geneExpress
```

**Format**

A data.frame with 10779 rows and 2 column

---

gene_ave	<i>Average the values of same genes in gene expression profile</i>
----------	--

---

**Description**

Average the values of same genes in gene expression profile

**Usage**

```
gene_ave(file_gene_ave, k = 1)
```

**Arguments**

file\_gene\_ave    a data.frame of gene expression data, each column is a sample, and each row is a gene.

k                a number, indicates which is the gene column.

**Value**

a data.frame, the values of same genes in gene expression profile

**Examples**

```
aa <- c("MARCH1", "MARC1", "MARCH1", "MARCH1", "MARCH1")
bb <- c(2.969058399, 4.722410064, 8.165514853, 8.24243893, 8.60815086)
cc <- c(3.969058399, 5.722410064, 7.165514853, 6.24243893, 7.60815086)
file_gene_ave <- data.frame(aa = aa, bb = bb, cc = cc)
colnames(file_gene_ave) <- c("Gene", "GSM1629982", "GSM1629983")

result <- gene_ave(file_gene_ave, 1)
```

---

gene_cov	<i>a data.frame of gene length and GC content</i>
----------	---

---

**Description**

the gene length and GC content data comes from TxDb.Hsapiens.UCSC.hg38.knownGene and BSgenome.Hsapiens.UCSC.hg38

**Usage**

```
gene_cov
```

**Format**

A data.frame with 27341 rows and 2 column

---

get_geo_array	<i>Get Microarray matrix data from GEO</i>
---------------	--

---

**Description**

Get Microarray matrix data from GEO

**Usage**

```
get_geo_array(gse)
```

**Arguments**

gse                    GSE number, such as GSE781.

**Value**

a list of matrix

**Examples**

```
arraylist <- get_geo_array("GSE781")
```

---

GSE66705_sample2	<i>a matrix of gene expression data in GEO</i>
------------------	--

---

**Description**

the first column represents the gene symbol

**Usage**

```
GSE66705_sample2
```

**Format**

A matrix with 999 rows and 3 column

**Details**

the other columns represent the expression of genes

---

id_conversion_TCGA	<i>Convert ENSEMBL gene id to gene Symbol in TCGA</i>
--------------------	---

---

**Description**

Convert ENSEMBL gene id to gene Symbol in TCGA

**Usage**

```
id_conversion_TCGA(profiles, toType = "SYMBOL")
```

**Arguments**

profiles	a data.frame of gene expression data, each column is a sample, and each row is a gene.
toType	one of 'keytypes(org.Hs.eg.db)'

**Value**

a data.frame, gene symbols and their expression value

**Examples**

```
library(org.Hs.eg.db)
data(profile)
result <- id_conversion_TCGA(profile)
```

---

kegg_liver	<i>a matrix of gene expression data in TCGA</i>
------------	---

---

**Description**

It is a randomly generated expression data used as an example of functions in this package. the first column represents the gene symbol

**Usage**

```
kegg_liver
```

**Format**

A matrix with 100 rows and 150 column

**Details**

the other columns represent the expression(count) of genes

---

Merge_methy_tcga	<i>Merge methylation data downloaded from TCGA</i>
------------------	--

---

### Description

When the methylation data is downloaded from TCGA, each sample is saved in a folder, which contains the methylation value file and the descriptive file. This function can directly extract and consolidate all folders.

### Usage

```
Merge_methy_tcga(dirr = NULL)
```

### Arguments

dirr	a string for the directory of methylation data download from tcga using the tools gdc
------	---

### Value

a matrix, a combined methylation expression spectrum matrix

### Examples

```
merge_result <- Merge_methy_tcga(system.file(file.path("extdata", "methy"),
  package = "GeoTcgaData"))
```

---

module	<i>a matrix of module name, gene symbols, and the number of gene symbols</i>
--------	--

---

### Description

It is a randomly generated expression data used as an example of functions in this package.

### Usage

```
module
```

### Format

A matrix with 176 rows and 3 column

---

prepare_chi	<i>Preparer file for chi-square test</i>
-------------	--

---

**Description**

Preparer file for chi-square test

**Usage**

```
prepare_chi(cnv)
```

**Arguments**

cnv                      result of ann\_merge()

**Value**

a matrix

**Examples**

```
cnv <- matrix(c(
  -1.09150, -1.47120, -0.87050, -0.50880,
  -0.50880, 2.0, 2.0, 2.0, 2.0, 2.0, 2.601962, 2.621332, 2.621332,
  2.621332, 2.621332, 2.0, 2.0, 2.0, 2.0, 2.0, 2.0, 2.0, 2.0,
  2.0, 2.0, 2.0, 2.0, 2.0, 2.0, 2.0),
  nrow = 5)
cnv <- as.data.frame(cnv)
rownames(cnv) <- c("AJAP1", "FHAD1", "CLCNKB", "CROCCP2", "AL137798.3")
colnames(cnv) <- c(
  "TCGA-DD-A4NS-10A-01D-A30U-01", "TCGA-ED-A82E-01A-11D-A34Y-01",
  "TCGA-WQ-A9G7-01A-11D-A36W-01", "TCGA-DD-AADN-01A-11D-A40Q-01",
  "TCGA-ZS-A9CD-10A-01D-A36Z-01", "TCGA-DD-A1EB-11A-11D-A12Y-01"
)
cnv_chi_file <- prepare_chi(cnv)
```

---

profile	<i>a matrix of gene expression data in TCGA</i>
---------	---

---

**Description**

It is a randomly generated expression data used as an example of functions in this package. the first column represents the gene symbol

**Usage**

```
profile
```

**Format**

A matrix with 10 rows and 10 column

**Details**

the other columns represent the expression(FPKM) of genes

---

repAssign	<i>Handle the case where one id corresponds to multiple genes</i>
-----------	---

---

**Description**

Handle the case where one id corresponds to multiple genes

**Usage**

```
repAssign(input_file, string)
```

**Arguments**

input_file	input file, a data.frame or a matrix, the first column should be genes.
string	a string, sep of the gene

**Value**

a data.frame, when an id corresponds to multiple genes, the expression value is assigned to each gene

**Examples**

```
aa <- c("MARCH1 /// MMA", "MARC1", "MARCH2 /// MARCH3",
        "MARCH3 /// MARCH4", "MARCH1")
bb <- c("2.969058399", "4.722410064", "8.165514853",
        "8.24243893", "8.60815086")
cc <- c("3.969058399", "5.722410064", "7.165514853",
        "6.24243893", "7.60815086")
input_file <- data.frame(aa = aa, bb = bb, cc = cc)

repAssign_result <- repAssign(input_file, " /// ")
```

---

repRemove	<i>Handle the case where one id corresponds to multiple genes</i>
-----------	---

---

**Description**

Handle the case where one id corresponds to multiple genes

**Usage**

```
repRemove(input_file, string)
```

**Arguments**

input_file	input file, a data.frame or a matrix, the first column should be genes.
string	a string, sep of the gene

**Value**

a data.frame, when an id corresponds to multiple genes, the expression value is deleted

**Examples**

```
aa <- c("MARCH1 /// MMA", "MARC1", "MARCH2 /// MARCH3",
        "MARCH3 /// MARCH4", "MARCH1")
bb <- c("2.969058399", "4.722410064", "8.165514853",
        "8.24243893", "8.60815086")
cc <- c("3.969058399", "5.722410064", "7.165514853",
        "6.24243893", "7.60815086")
input_file <- data.frame(aa = aa, bb = bb, cc = cc)
repRemove_result <- repRemove(input_file, " /// ")
```

---

SNP_QC	<i>Do quality control of SNP data downloaded from TCGAbiolinks</i>
--------	--

---

**Description**

Do quality control of SNP data downloaded from TCGAbiolinks

**Usage**

```
SNP_QC(
  snpData,
  geon = 0.02,
  mind = 0.02,
  maf = 0.05,
  hwe = 1e-06,
  miss = "NoCall"
)
```

**Arguments**

snpData	data.frame of SNP data downloaded from TCGAbiolinks
geon	filters out all variants with missing call rates exceeding the provided value (default 0.02) to be removed
mind	filters out all samples with missing call rates exceeding the provided value (default 0.02) to be removed
maf	filters out all variants with minor allele frequency below the provided threshold
hwe	filters out all variants which have Hardy-Weinberg equilibrium exact test p-value below the provided threshold
miss	character of miss value

**Value**

data.frame

**Examples**

```
# use demo data
snpDf <- matrix(sample(c("AA", "Aa", "aa"), 100, replace = TRUE), 10, 10)
snpDf <- as.data.frame(snpDf)
sampleGroup <- sample(c("A", "B"), 10, replace = TRUE)
result <- SNP_QC(snpDf)
```

---

ventricle

*a matrix of gene expression data in GEO*

---

**Description**

It is a randomly generated expression data used as an example of functions in this package. the first column represents the gene symbol

**Usage**

```
ventricle
```

**Format**

A matrix with 32 rows and 20 column

**Details**

the other columns represent the expression of genes
