Package ‘MatrixRider’

March 26, 2015

Type  Package
Title  Obtain total affinity and occupancies for binding site matrices on a given sequence
Version  0.99.6
Date  2015-11-02
Author  Elena Grassi
Maintainer  Elena Grassi <grassi.e@gmail.com>
Description  Calculates a single number for a whole sequence that reflects the propensity of a DNA binding protein to interact with it. The DNA binding protein has to be described with a PFM matrix, for example gotten from Jaspar.

biocViews  GeneRegulation, Genetics, MotifAnnotation
License  GPL-3
Depends  R (>= 3.1.2)
Imports  methods, TFBSTools, IRanges, XVector, Biostrings
Suggests  RUnit, BiocGenerics, BiocStyle, JASPAR2014
LinkingTo  IRanges, XVector, Biostrings, S4Vectors
NeedsCompilation  yes

Index  4
MatrixRider-package  Calculate total affinity and occupancies for binding site matrices on a given sequence

Description

Calculates a single number for a whole sequence that reflects the propensity of a DNA binding protein to interact with it. The DNA binding protein has to be described with a PFM matrix, for example gotten from Jaspar.

Author(s)

Elena Grassi <elena.grassi@unito.it>

Examples

```r
library(JASPAR2014)
library(TFBSTools)
library(Biostrings)
pfm <- getMatrixByID(JASPAR2014,"MA0004.1")
## The following sequence has a single perfect match
## thus it gives the same results with all cutoff values.
sequence <- DNAString("CACGTG")
getSeqOccupancy(sequence, pfm, 0.1)
getSeqOccupancy(sequence, pfm, 1)
```

getSeqOccupancy  Computes the total affinity or the occupancy at a given cutoff

Description

The affinity/occupancy is calculated on the given DNAString for the given PFMatrix (or all the ones in the PFMatrix list given).

Usage

```r
getSeqOccupancy(sequence, pfm, cutoff)
```

Arguments

- `sequence` A DNAString object with the sequence for which affinity will be computed.
- `pfm` A PFMatrix or a PFMatrixList object with the matrixes whose affinity will be calculated. The background (bg.XMatrix-method) of the given pfm is used to perform affinity calculations.
- `cutoff` numeric(1); between 0 and 1 (included): 0 corresponds to total affinity (i.e. summing all the affinities) while 1 to summing only values corresponding to the perfect match for a given PFMatrix. See vignette for details on how scores are calculated. If MatrixRider is installed, open the vignette with vignette("MatrixRider").
`getSeqOccupancy`  

**Value**

numeric; the resulting total affinity calculated on the given fasta. If a `PFMatrixList` has been passed then a named numeric vector with the affinities for all the PFM. The vignette has all the details on the calculations (such as PFM to PWM conversion and pseudocounts).

**Examples**

```r
library(JASPAR2014)
library(TFBSTools)
library(Biostrings)
pfm <- getMatrixByID(JASPAR2014,"MA0004.1")
## The following sequence has a single perfect match
## thus it gives the same results with all cutoff values.
sequence <- DNAString("CACGTG")
getSeqOccupancy(sequence, pfm, 0.1)
getSeqOccupancy(sequence, pfm, 1)

pfm2 <- getMatrixByID(JASPAR2014,"MA0005.1")
pfms <- PFMatrixList(pfm, pfm2)
names(pfms) <- c(name(pfm), name(pfm2))
## This calculates total affinity for both the PFMatrix.
getSeqOccupancy(sequence, pfms, 0)
```
