Package ‘flowMerge’

March 26, 2015

Type Package
Title Cluster Merging for Flow Cytometry Data
Version 2.15.0
Date 2011-05-26
Author Greg Finak <gfinak@fhcrc.org>, Raphael Gottardo <rgottard@fhcrc.org>
Maintainer Greg Finak <gfinak@fhcrc.org>
Description Merging of mixture components for model-based automated gating of flow cytometry data using the flowClust framework.
Note: users should have a working copy of flowClust 2.0 installed.
License Artistic-2.0
LazyLoad yes
Depends graph,feature,flowClust,Rgraphviz,foreach,snow
Enhances doMC, multicore
Imports rrcov,flowCore, graphics, methods, stats, utils
biocViews Clustering, FlowCytometry
NeedsCompilation no

### Description

Merges mixture components from the `flowClust` framework based on the entropy of clustering and provides a simple representation of complicated, non-convex cell populations.

### Details

High density, non-convex cell populations in flow cytometry data often require multiple mixture components for a good model fit. The components are often overlapping, resulting in a complicated representation of individual cell populations. `flowMerge` merges overlapping mixture components (based on the max BIC `flowClust` model fit) in an iterative manner based on an entropy criterion, allowing these cell populations to be represented by individual mixture components while retaining the good model fitting properties of the BIC solution. Estimates of the number of clusters from a `flowMerge` model more accurately represent the "true" number of cell populations in the data. Running `flowMerge` is relatively straightforward. A `flowClust` object is converted to a `flowObj`
object, which groups the model and the data (a flowFrame) into a single object. This is done by a
call to flowObj(model, data) with a call to merge, which takes a flowObj object. The algorithm
may be run in parallel on a multi-core machine or a networked cluster of machines. It uses the
functionality in the snow package to achieve this. Parallelized calls to flowClust are available via
the pflowClust and pflowMerge functions.

flowMerge has functionality to automatically select the “correct” number of clusters by fitting a
piecewise linear model to the entropy of clustering vs number of clusters, and locating the position
of the changepoint. The piecewise linear model fitting is invoked by a call to fitPiecewiseLinreg,
which returns the location of the changepoint.

Examples
#data(rituximab)
#data(RituximabFlowClustFit)
#o<-flowObj(flowClust.res[[which.max(flowMerge:::bic(flowClust.res))]],rituximab);
#m<-merge(o);
#i<-fitPiecewiseLinreg(m);
#m<-m[[i]];
#plot(m,pch=20,level=0.9);
checkForRemoteErrors  

Check output of snow clusters for errors

Description
Overrides the snow checkForRemoteErrors function. Try errors are returned when cluster nodes
produce errors, rather than completely aborting the computation. Not meant to be called by the user.

Usage
checkForRemoteErrors(val)
Arguments
val The result returned from an individual cluster node.

Details
This function is meant to be called internally, but must be exported so that it can hide the native checkForRemoteErrors function in the snow package.

Value
The result from the snow cluster node, or an object of type try-error if there was an error.

fitPiecewiseLinreg  Fit Piecewise Linear Regression for a list of flowMerge Objects

Description
Fits a two–component piecewise linear regression to the entropy vs number of clusters for a list of merged cluster solutions.

Usage
fitPiecewiseLinreg(x, plot=FALSE, normalized=TRUE, ...)

Arguments
x A "list" of flowMerges objects for 1 through K clusters derived from a single max BIC flowObj or flowClust object.
plot A logical indicating whether to plot the fit or not. Default is FALSE.
normalized A logical indicating whether the merging should be done using the normalized or unnormalized entropy
... Additional arguments not currently used.
Details

An S4 method that takes a list of flowMerge objects output by the merge method, extracts the entropy and fits a piecewise linear regression to the entropy vs number of clusters in order to find the position of the changepoint. The location of the changepoint corresponds to the optimal merged cluster solution. The piecewise linear regression now is fitted to the entropy vs cumulative sum of merged observations at each number of clusters. This normalizes the change in entropy for the number of data points as described in Baudry et al.

Value

An integer value corresponding to the position of the changepoint.

Author(s)

Greg Finak <<greg.finak@ircm.qc.ca>>

merge

Examples

```r
#data(rituximab)
data(RituximabFlowClustFit)
o<-flowObj(flowClust.res[[which.max(BIC(flowClust.res))]],rituximab);
m<-merge(o)
i<-fitPiecewiseLinreg(m);
```

Description

Methods for the function fitPiecewiseLinreg in the package flowMerge

Methods

x = "list"  A list of flowMerge objectes derived from a call to the merge function.
flagOutliers-methods

References

Finak G, Bashasharti A, Brinkmann R, Gottardo R. Merging Mixture Model Components for Improved Cell Population Identification in High Throughput Flow Cytometry Data; Advances in Bioinformatics (To Appear)

flagOutliers

Update the flagOutliers slot in a flowMerge object

Description

Update the flagOutliers slot in a flowMerge object. This method is internal and called automatically from within the merging code.

Usage

flagOutliers(object,...)

Arguments

object An object of type flowMerge
... Additional arguments, currently unused.

flagOutliers-methods

Methods to update the flagOutliers slot in a flowMerge object.

Description

Methods that update the flagOutliers slot in a flowMerge object so that they reflect the outliers in the new merged clustering. This is an internal function, not meant for user consumption. It is called from within the merge method.

Methods

object = "flowMerge" Update the flagOutliers slot for an object of type flowMerge
A flowClust model fitted to the rituximab data for 1:10 clusters.

Description

The Rituximab data set accessible via data(rituximab) in the flowClust package fitted to a flowClust model containing from one to ten components. The results are in the object flowClust.res.

Usage

data(RituximabFlowClustFit)

Format

The format is: flowClust.res is a flowClustList, where each element of the list is a flowClust model of the rituximab data, for K=1 through K=10 components, respectively. The structure of flowClustList and flowClust can be found in the corresponding documentation of the flowClust package. The format of the rituximab data is found in the documentation for that data set.

Details

The models have been precomputed for use in flowMerge examples to save computation time. flowClust was called on the rituximab data to generate these models with the following command:

flowClust.res<-flowClust(rituximab,K=1:10,B=1000,B.init=100,tol=1e-5,tol.init=1e-2,nu=4,randomStart=T)

Source

Examples

#data(RituximabFlowClustFit)
#summary(flowClust.res);

flowMerge-class

Class "flowMerge"

Description

A class to represent flowMerge objects
Objects from the Class

The object unites the flowMerge model output and the data being modeled and contains additional slots for various characteristics of a merged cluster solution, including the entropy of clustering.

Slots

merged: The number of observations merged at the current step in the algorithm.
mTree: A tree-structured graph representing the order of merged components in the model. Inspired by SPADE. (Bendall et al.)
entropy: The entropy of clustering of the current solution.
DATA: An environment whose first element contains the flowFrame with the data modeled by this flowMerge object
expName: See the flowClust package for details
varNames: See the flowClust package for details
K: The number of clusters in the merged solution. See the flowClust package for details
w: The proportions for each component in the merged solution. See the flowClust package for details
mu: The means of the components in the merged solution. See the flowClust package for details
sigma: The covariances of the components in the merged solution. See the flowClust package for details
lambda: See the flowClust package for details
nu: See the flowClust package for details
z: See the flowClust package for details
u: The uncertainties for each data point.
label: See the flowClust package for details
uncertainty: See the flowClust package for details
ruleOutliers: See the flowClust package for details
flagOutliers: See the flowClust package for details
rm.min: See the flowClust package for details
rm.max: See the flowClust package for details
logLike: See the flowClust package for details
BIC: See the flowClust package for details
ICL: See the flowClust package for details

Extends

Class "flowObj", directly. Class "flowClust", by class "flowObj", distance 2.
Methods

- **getData** signature(obj = "flowMerge"): Retrieves the flowFrame in the DATA environment slot.
- **plot** signature(x = "flowMerge", y = "missing"): Plots the clusters in this object.
- **summary** signature(x="flowMerge"): Prints a summary of the object.
- **show** signature(x="flowMerge"): Prints information about the object.

- flowObj-class

---

**flowObj**

*Create a flowObj object from a flowClust and flowFrame object*

Description

Convenience method that creates a flowObj object from a flowClust and flowFrame object, so as to group the model and data together. Useful for high-throughput analysis where one may want to access the data to compute other statistics.

Usage

```r
flowObj(flowC = NULL, flowF = NULL)
```

Arguments

- **flowC** A flowClust object representing the model fit
- **flowF** A flowFrame object on which the flowClust model is based.

Details

Calls the `new("flowObj",...)` constructor.

Value

An object of class flowObj-class
Author(s)
Greg Finak <<greg.finak@ircm.qc.ca>>, Raphael Gottardo <<raphael.gottardo@ircm.qc.ca>>

data(RituximabFlowClustFit)
o<-flowObj(flowClust.res[[which.max(flowMerge:::BIC(flowClust.res))]],rituximab);
m<-merge(o);

flowObj-class  Class "flowObj"

Description
A class inheriting from flowClust that groups the model and data in a single object.

Objects from the Class
Objects can be created by calls of the form new("flowObj", ...). Has a convenience method flowObj(flowClustObj, flowFrameObj) for creating instances of the class.

Slots
DATA: An "environment" that holds a pointer to the flowFrame data in position [[1]].
exName: As described in the flowClust documentation
varNames: As described in the flowClust documentation
K: As described in the flowClust documentation
w: As described in the flowClust documentation
nu: As described in the flowClust documentation
sigma: As described in the flowClust documentation
lambda: As described in the flowClust documentation
nu: As described in the flowClust documentation
z: As described in the flowClust documentation
As described in the `flowClust` documentation

- `u`: As described in the `flowClust` documentation
- `label`: As described in the `flowClust` documentation
- `uncertainty`: As described in the `flowClust` documentation
- `ruleOutliers`: As described in the `flowClust` documentation
- `flagOutliers`: As described in the `flowClust` documentation
- `rm.min`: As described in the `flowClust` documentation
- `rm.max`: As described in the `flowClust` documentation
- `logLike`: As described in the `flowClust` documentation
- `BIC`: As described in the `flowClust` documentation
- `ICL`: As described in the `flowClust` documentation

**Extends**

Class "`flowClust`", directly.

**Methods**

- `getData` signature(obj = "flowObj"): Retrieves the contents of the DATA environment
- `merge` signature(x = "flowObj", y = "missing"): the `flowMerge` algorithm is called via this function on objects of type `flowObj`.
- `plot` signature(x = "flowObj", y = "missing"): A simplified plotting method. Does not require specification of the data since it is contained in the `flowObj` object. Takes most of the same parameters as `plot.flowClust`, except the data parameter

initPFlowMerge  
*Initialize a SNOW cluster for use with flowMerge*

**Description**

Initializes a snow cluster for use with flowMerge, ensures that the flowMerge library is loaded in all environments. Not meant to be called by the user.

**Usage**

`initPFlowMerge(cl)`

**Arguments**

- `cl`  
  A snow cluster

**Details**

A valid snow cluster.

`pFlowMerge`

---

map  
*Map matrix of probabilities to class assignments.*

**Description**

Traverse the rows of a matrix of probabilities of size n x k, where the n rows are samples, and the k columns are the probability of assignment of the sample to each of k classes. The most probable class assignment is selected for each row and a vector of classes is returned.

**Usage**

`map(z, ...)`
Arguments

- `z` A matrix of probabilities.
- `...` Additional arguments, not currently used.

Value

A vector of class assignments of length n.

Author(s)

Greg Finak <greg.finak@ircm.qc.ca>, Raphael Gottardo <raphael.gottardo@ircm.qc.ca>

Examples

```r
z <- t(apply(t(replicate(100,rgamma(5,0.1,1))),1,function(x)x/sum(x)));
map(z);
```

Description

Merge clusters in flow cytometry data

Usage

```r
merge(x, y, ...)
```

Arguments

- `x` A `flowObj` object created from a `flowClust` object and a `flowFrame` using the `flowObj` constructor.
- `y` missing
- `...` Additional arguments, i.e. `metric="entropy" | "mahalanobis"

Details

Run the cluster merging algorithm on the max BIC solution from a call to `flowClust`. The optional argument, `metric` specifies the measure used for clustering. Either "mahalanobis" or "entropy". Defaults to "entropy".

Value

A list of unnamed `flowMerge` objects. The first element of the list corresponds to the 1–cluster merged solution. The second element corresponds to the 2–cluster merged solution, and so on.

m<-merge(o);
```

merge-methods  

**Merge mixture components**

Description
Merge mixture components in a flowObj derived from a flowClust result and a flowFrame using the cluster merging algorithm.

Value
An unnamed list of flowMerge objects with the kth element corresponding to the k-cluster merged solution.

Methods

- **x = "ANY", y = "ANY"** The generic method. Should not be called.
- **x = "flowObj", y = "missing"** The merge method for a flowObj.

merge
Description

Extracts the normalized entropy from a list of flowMerge objects.

Usage

NENT(x)

Arguments

x

A list of flowMerge objects

Details

The normalized entropy is extracted from a flowMerge object by computing \( \frac{E}{K \times n} \) where \( E \) is the entropy, and \( K \) and \( n \) are the number of clusters and data points, respectively.

Value

Returns a vector of normalized entropy values for the flowMerge objects.

Warning

This function doesn’t do enough error checking and will try to extract the entropy from a list of anything.

Author(s)

Greg Finak <<greg.finak@ircm.qc.ca>>

References

Finak G, Bashasharti A, Brinkmann R, Gottardo R. Merging Mixture Model Components for Improved Cell Population Identification in High Throughput Flow Cytometry Data; Advances in Bioinformatics (To Appear)

ENT, merge, flowMerge-class
Examples

```r
#data(RituximabFlowClustFit)
data(rituximab)
o<flowObj(flowClust.res[[which.max(flowMerge:::BIC(flowClust.res))]],rituximab);
merge<merge(o);
flowMerge:::ENT(m);
flowMerge:::NENT(m);
```

Description

A parallelized call to flowClust via the snow package and framework. Not called by the user.

Usage

```r
pFlowClust(flowData, cl, K = 1:15, B.init = 100, tol.init = 0.01, tol = 1e-05, B = 1000, randomStart = 5)
```

Arguments

- `flowData`: The data object, must be a flowFrame, flowSet or list of flowFrames
- `cl`: The snow cluster object
- `K`: The number of clusters to try for each flowFrame. Can be a vector. This is what is parallelized across processors.
- `B.init`: See flowClust documentation
- `tol.init`: See flowClust documentation
- `tol`: See flowClust documentation
- `B`: See flowClust documentation
- `randomStart`: See flowClust documentation
- `nu`: See flowClust documentation
- `nu.est`: See flowClust documentation
- `trans`: See flowClust documentation
- `varNames`: See flowClust documentation

Details

Calls flowClust via the clusterMap method of the snow package. Parallelizes the computation of multiple components for a single flowFrame in a loop over multiple flowFrames. If the snow cluster is NULL, will make the call via mapply.
Value

Returns a list of lists of flowClust objects. The outer list corresponds to the flowFrames passed into the method. The inner list corresponds to the K cluster solutions passed into the method, for each flowFrame (i.e., if the input is a list of two flowFrames, and K=1:10, then the result is a list of length 2. Each element of the list is itself a list of length 10. The kth element of the inner list is the flowClust k cluster solution.)

</tr>
<tr>
<td>varNames</td>
<td>See flowClust documentation</td>
</tr>
</tbody>
</table>
Details

Makes a parallelized call to `flowClust`. Parses the results to extract the max BIC solution, merges clusters, finds the optimal k-cluster solution using the entropy and returns it. If `cl` is NULL, a non-parallel call is made to the `flowClust` function.

Value

A list of `flowMerge` objects. One per `flowFrame` passed into the method.

Warning

This function does not do any special memory management. A large data set will likely cause it to run out of memory and start swapping incessantly. If you have lots of data, it’s best to feed it piecewise to `pFlowClust`.

**ptree**

*Generate a Function to Plot The Merging Tree*

**Description**

This function generates and returns a new function which can be used to plot the merging tree for a flowMerge model, with nodes highlighted based on the expression of different parameters for each cell population.

**Usage**

`ptree(x, y)`

**Arguments**

- `x`  
  A character string of the name of the variable holding the list of merged models returned from flowMerge

- `y`  
  The index of the best fitting merged model in that list

**Methods**

- `x = "flowMerge", y = "missing"`  
  `x` is a `flowMerge` object.

- `x = "flowObj", y = "missing"`  
  `x` is a `flowObj` object.

**See Also**

- `flowClust`
Details

ptree will generate a function that will plot the merging tree from a flowMerge model. Nodes will be colored by the intensity of staining of that population in a given dimension. Calling `f<-ptree("model.name",fitPiecewiseLinReg(model.name))` will assign the function to `f`. Calling `f(3)` will plot the merging tree with nodes highlighted according to parameter 3, presuming that there are that many parameters in the model.

Value

Returns a function

Side Effects

A plot will be drawn on the current device.

`merge`, `showMmethods`

---

show-methods

`showMmethods` Describe a `flowObj` or `flowMerge` object

Description

Accessors to describe a `flowObj` or `flowMerge` object.

Methods

- `object = "flowMerge"` Describe a `flowMerge` object.
- `object = "flowObj"` Describe a `flowObj` object.

split-methods

`split-methods` Split data in a `flowMerge` object by cluster

Description

Split method defined for `flowMerge` objects. Pulls out the population based on cluster number.

Methods

- `itemx = "flowMerge", f = "missing"` Split a `flowMerge` object into its component clusters.
Description

Summary method for flowMerge objects.

Methods

object = "flowMerge"  Summarize a flowMerge object.
object = "flowObj"  Summarize a flowObj object

updateU

Update uncertainties

Description

Updates the uncertainties in a flowMerge object after merging clusters. This function is now internal and no longer exported. It is called automatically within the cluster merging method.

Usage

updateU(object)

Arguments

object An object of type flowMerge

Details

Updates the u slot of the flowMerge object following merging. The update is computation intensive, and so, is not automatically performed on each flowMerge object. Should only be done on objects used in further analysis.

Value

A flowMerge object with the u slot updated to reflect the new parameter values.
