

# Package ‘SAIGEgds’

October 2, 2022

**Type** Package

**Title** Scalable Implementation of Generalized mixed models using GDS files in Phenome-Wide Association Studies

**Version** 1.10.0

**Date** 2022-03-28

**Depends** R (>= 3.5.0), gdsfmt (>= 1.20.0), SeqArray (>= 1.31.8), Rcpp

**LinkingTo** Rcpp, RcppArmadillo, RcppParallel (>= 5.0.0)

**Imports** methods, stats, utils, RcppParallel, SPAtest (>= 3.0.0)

**Suggests** parallel, crayon, RUnit, knitr, markdown, rmarkdown, BiocGenerics, SNPRelate, ggmanh

**Description** Scalable implementation of generalized mixed models with highly optimized C++ implementation and integration with Genomic Data Structure (GDS) files. It is designed for single variant tests in large-scale phenome-wide association studies (PheWAS) with millions of variants and samples, controlling for sample structure and case-control imbalance. The implementation is based on the original SAIGE R package (v0.29.4.4 for single variant tests, Zhou et al. 2018). SAIGEgds also implements some of the SPAtest functions in C to speed up the calculation of Saddlepoint approximation. Benchmarks show that SAIGEgds is 5 to 6 times faster than the original SAIGE R package.

**License** GPL-3

**SystemRequirements** C++11, GNU make

**VignetteBuilder** knitr

**ByteCompile** TRUE

**URL** <https://github.com/AbbVie-ComputationalGenomics/SAIGEgds>

**biocViews** Software, Genetics, StatisticalMethod, GenomeWideAssociation

**git\_url** <https://git.bioconductor.org/packages/SAIGEgds>

**git\_branch** RELEASE\_3\_15

**git\_last\_commit** 9c55c6f

**git\_last\_commit\_date** 2022-04-26

**Date/Publication** 2022-10-02

**Author** Xiuwen Zheng [aut, cre] (<<https://orcid.org/0000-0002-1390-0708>>),  
Wei Zhou [ctb] (the original author of the SAIGE R package),  
J. Wade Davis [ctb]

**Maintainer** Xiuwen Zheng <xiuwen.zheng@abbvie.com>

SAIGEgds-package	<i>Scalable Implementation of Generalized mixed models in Phenome-Wide Association Studies using GDS files</i>
------------------	--

---

## Description

Scalable and accurate implementation of generalized mixed mode with the support of Genomic Data Structure (GDS) files and highly optimized C++ implementation. It is designed for single variant tests in large-scale phenome-wide association studies (PheWAS) with millions of variants and hundreds of thousands of samples, e.g., UK Biobank genotype data, controlling for case-control imbalance and sample structure in single variant association studies.

The implementation of SAIGEgds is based on the original SAIGE R package (v0.29.4.4) [Zhou et al. 2018] <https://github.com/weizhouUMICH/SAIGE/releases/tag/v0.29.4.4>. All of the calculation with single-precision floating-point numbers in SAIGE are replaced by the double-precision calculation in SAIGEgds. SAIGEgds also implements some of the SPAtest functions in C to speed up the calculation of Saddlepoint Approximation.

## Details

Package: SAIGEgds  
Type: Package  
License: GPL version 3

**Author(s)**

Xiuwen Zheng <xiuwen.zheng@abbvie.com>, Wei Zhou (the original author of the SAIGE R package, <https://github.com/weizhouUMICH/SAIGE>)

**References**

**Examples**

```
# open the GDS file
fn <- system.file("extdata", "grm1k_10k_snp.gds", package="SAIGEgds")
gdsfile <- seqOpen(fn)

# load phenotype
phenofn <- system.file("extdata", "pheno.txt.gz", package="SAIGEgds")
pheno <- read.table(phenofn, header=TRUE, as.is=TRUE)
head(pheno)

# fit the null model
glmm <- seqFitNullGLMM_SPA(y ~ x1 + x2, pheno, gdsfile, trait.type="binary")

# p-value calculation
assoc <- seqAssocGLMM_SPA(gdsfile, glmm, mac=10)

head(assoc)

# close the GDS file
seqClose(gdsfile)
```

---

glmmHeritability

*Heritability estimation*

---

**Description**

Get the heritability estimate from the SAIGE model.

**Usage**

```
glmmHeritability(modobj, adjust=TRUE)
```

**Arguments**

<code>modobj</code>	an R object for SAIGE model parameters
<code>adjust</code>	if TRUE and binary outcomes, uses adjusted tau estimate for the heritability estimation

**Details**

In SAIGE, penalized quasi-likelihood (PQL) is used to estimate the variance component parameter tau. It is known to produce biased estimate of the variance component tau using PQL. If `adjust=TRUE` for binary outcomes, tau is adjusted based prevalence and observed tau using the data in Supplementary Table 7 (Zhou et al. 2018) to reduce the bias of PQL estimate of variance component.

**Value**

Return a liability scale heritability.

**Author(s)**

Xiuwen Zheng

**Examples**

```
# open a GDS file
fn <- system.file("extdata", "grm1k_10k_snp.gds", package="SAIGEgds")
gdsfile <- seqOpen(fn)

# load phenotype
phenofn <- system.file("extdata", "pheno.txt.gz", package="SAIGEgds")
pheno <- read.table(phenofn, header=TRUE, as.is=TRUE)
head(pheno)

# fit the null model
glmm <- seqFitNullGLMM_SPA(y ~ x1 + x2, pheno, gdsfile, trait.type="binary")

glmmHeritability(glmm)

seqClose(gdsfile)
```

---

pACAT	<i>Cauchy Combination Test</i>
-------	--------------------------------

---

**Description**

P-value calculation from Cauchy combination test.

**Usage**

```
pACAT(p, w=NULL)
pACAT2(p, maf, wbeta=c(1,25))
```

**Arguments**

p	a numeric vector for p-values
w	weight for each p-value
maf	minor allele frequency for each p-value
wbeta	weights for per-variant effect, using beta distribution <code>dbeta()</code> according to variant's MAF

**Value**

Return a single number for the combined p-value.

**References**

Liu Y., Cheng S., Li Z., Morrison A.C., Boerwinkle E., Lin X.; ACAT: A Fast and Powerful p Value Combination Method for Rare-Variant Analysis in Sequencing Studies. *Am J Hum Genetics* 104, 410-421 (2019).

**See Also**

[seqFitNullGLMM\\_SPA](#), [seqAssocGLMM\\_SPA](#)

**Examples**

```
p1 <- 10^-4
p2 <- 10^-5
p3 <- 10^-(3:20)
sapply(p3, function(p) pACAT(c(p1, p2, p)))

pACAT2(c(10^-4, 10^-6), c(0.01, 0.005))
```

---

seqAssocGLMM\_SPA      *P-value calculation*

---

### Description

P-value calculations using variance approximation and an adjustment of Saddlepoint approximation in the mixed model framework.

### Usage

```
seqAssocGLMM_SPA(gdsfile, modobj, maf=NaN, mac=10, missing=0.1, dsnode="",
  spa.pval=0.05, var.ratio=NaN, res.savefn="", res.compress="LZMA",
  parallel=FALSE, verbose=TRUE)
```

### Arguments

<code>gdsfile</code>	a SeqArray GDS filename, or a GDS object
<code>modobj</code>	an R object for SAIGE model parameters
<code>maf</code>	minor allele frequency threshold (checking $\geq$ maf), NaN for no filter
<code>mac</code>	minor allele count threshold (checking $\geq$ mac), NaN for no filter
<code>missing</code>	missing threshold for variants (checking $\leq$ missing), NaN for no filter
<code>dsnode</code>	"" for automatically searching the GDS nodes "genotype" and "annotation/format/DS", or use a user-defined GDS node in the file
<code>spa.pval</code>	the p-value threshold for SPA adjustment, 0.05 by default (since normal approximation performs well when the test statistic is close to the mean)
<code>var.ratio</code>	NaN for using the estimated variance ratio in the model fitting, or a user-defined variance ratio
<code>res.savefn</code>	an RData or GDS file name, "" for no saving
<code>res.compress</code>	the compression method for the output file, it should be one of LZMA, LZMA_RA, ZIP, ZIP_RA and none
<code>parallel</code>	FALSE (serial processing), TRUE (multicore processing), a numeric value for the number of cores, or other value; <code>parallel</code> is passed to the argument <code>c1</code> in <a href="#">seqParallel</a> , see <a href="#">seqParallel</a> for more details
<code>verbose</code>	if TRUE, show information

### Details

The original SAIGE R package uses 0.05 as a threshold for unadjusted p-values (based on asymptotic normality) to further calculate adjusted p-values (Saddlepoint approximation, SPA). If `var.ratio=NaN`, the average of variance ratios (`mean(modobj$var.ratio$ratio)`) is used instead. For more details of SAIGE algorithm, please refer to the SAIGE paper [Zhou et al. 2018] (see the reference section).

**Value**

Return a `data.frame` with the following components if not saving to a file:

<code>id</code>	variant ID in the GDS file;
<code>chr</code>	chromosome;
<code>pos</code>	position;
<code>rs.id</code>	the RS IDs if it is available in the GDS file;
<code>ref</code>	the reference allele;
<code>alt</code>	the alternative allele;
<code>AF.alt</code>	allele frequency for the alternative allele; the minor allele frequency is $\min(\text{AF.alt}, 1-\text{AF.alt})$ ;
<code>mac</code>	minor allele count; the allele count for the alternative allele is $\text{ifelse}(\text{AF.alt} \leq 0.5, \text{mac}, 2 * \text{num} - \text{mac})$ ;
<code>num</code>	the number of samples with non-missing genotypes;
<code>beta</code>	beta coefficient, odds ratio if binary outcomes (alternative allele vs. reference allele);
<code>SE</code>	standard error for beta coefficient;
<code>pval</code>	adjusted p-value with the Saddlepoint approximation method;
<code>p.norm</code>	p-values based on asymptotic normality (could be 0 if it is too small, e.g., $\text{pnorm}(-50) = 0$ in R; used for checking only
<code>converged</code>	whether the SPA algorithm converges or not for adjusted p-values.

**Examples**

```
# open a GDS file
fn <- system.file("extdata", "grm1k_10k_snp.gds", package="SAIGEgds")
gdsfile <- seqOpen(fn)

# load phenotype
phenofn <- system.file("extdata", "pheno.txt.gz", package="SAIGEgds")
pheno <- read.table(phenofn, header=TRUE, as.is=TRUE)
```

```

head(pheno)

# fit the null model
glmm <- seqFitNullGLMM_SPA(y ~ x1 + x2, pheno, gdsfile, trait.type="binary")

# p-value calculation
assoc <- seqAssocGLMM_SPA(gdsfile, glmm, mac=10)
head(assoc)

# close the GDS file
seqClose(gdsfile)

```

---

```
seqAssocGLMM_spaACAT_O
```

*ACAT-V tests*

---

## Description

ACAT-O combined p-value calculations using mixed models and the Saddlepoint approximation method for case-control imbalance.

## Usage

```
seqAssocGLMM_spaACAT_O(gdsfile, modobj, units, wbeta=AggrParamBeta,
  burden.mac=10, burden.summac=3, dsnode="", spa.pval=0.05, var.ratio=NaN,
  res.savefn="", res.compress="LZMA", parallel=FALSE,
  verbose=TRUE, verbose.maf=TRUE)
```

## Arguments

<code>gdsfile</code>	a SeqArray GDS filename, or a GDS object
<code>modobj</code>	an R object for SAIGE model parameters
<code>units</code>	a list of units of selected variants, with S3 class "SeqUnitListClass" defined in the SeqArray package
<code>wbeta</code>	weights for per-variant effect, using beta distribution <code>dbeta()</code> according to variant's MAF; a length-two vector, or a matrix with two rows for multiple beta parameters; by default, using <code>beta(1,1)</code> and <code>beta(1,25)</code> both
<code>burden.mac</code>	a threshold of minor allele count for using burden test instead of single variant test if <code>mac &lt; burden.mac</code>
<code>burden.summac</code>	a threshold for the weighted sum of minor allele counts in burden test (checking <code>&gt;= burden.summac</code> )
<code>dsnode</code>	"" for automatically searching the GDS nodes "genotype" and "annotation/format/DS", or use a user-defined GDS node in the file
<code>spa.pval</code>	the p-value threshold for SPA adjustment, 0.05 by default
<code>var.ratio</code>	NaN for using the estimated variance ratio in the model fitting, or a user-defined variance ratio

res.savefn	an RData or GDS file name, "" for no saving
res.compress	the compression method for the output file, it should be one of LZMA, LZMA_RA, ZIP, ZIP_RA and none
parallel	FALSE (serial processing), TRUE (multicore processing), a numeric value for the number of cores, or other value; parallel is passed to the argument c1 in <a href="#">seqParallel</a> , see <a href="#">seqParallel</a> for more details
verbose	if TRUE, show information
verbose.maf	if TRUE, show summary of MAFs in units

### Details

The original SAIGE R package uses 0.05 as a threshold for unadjusted p-values to further calculate SPA-adjusted p-values. If `var.ratio=NaN`, the average of variance ratios (`mean(modobj$var.ratio$ratio)`) is used instead. For more details of SAIGE algorithm, please refer to the SAIGE paper [Zhou et al. 2018] (see the reference section). No SKAT implementation.

### Value

Return a data.frame with the following components if not saving to a file: chr, chromosome; start, a starting position; end, an ending position; numvar, the number of variants in a window; summac, the weighted sum of minor allele counts; beta, beta coefficient, odds ratio if binary outcomes; SE, standard error for beta coefficient; pval, adjusted p-value with Saddlepoint approximation;

p.norm                    p-values based on asymptotic normality (could be 0 if it is too small, e.g., `pnorm(-50) = 0` in R; used for checking only

cvg, whether the SPA algorithm converges or not for adjusted p-value.

---

seqFitNullGLMM\_SPA      *Fit the null model with GRM*

---

**Description**

Fit the null model in the mixed model framework with genetic relationship matrix (GRM).

**Usage**

```

seqFitNullGLMM_SPA(formula, data, gdsfile, trait.type=c("binary", "quantitative"),
  sample.col="sample.id", maf=0.005, missing.rate=0.01, max.num.snp=1000000L,
  variant.id=NULL, inv.norm=TRUE, X.transform=TRUE, tol=0.02, maxiter=20L,
  nrun=30L, tolPCG=1e-5, maxiterPCG=500L, num.marker=30L, tau.init=c(0,0),
  traceCVcutoff=0.0025, ratioCVcutoff=0.001, geno.sparse=TRUE, num.thread=1L,
  model.savefn="", seed=200L, fork.loading=FALSE, verbose=TRUE)

```

**Arguments**

formula	an object of class formula (or one that can be coerced to that class), e.g., $y \sim x_1 + x_2$ , see <a href="#">lm</a>
data	a data frame for the formulas
gdsfile	a SeqArray GDS filename or a GDS object for genotypes used in the GRM calculation
trait.type	"binary" for binary outcomes, "quantitative" for continuous outcomes
sample.col	the column name of sample IDs corresponding to the GDS file

maf	minor allele frequency for imported genotypes (checking $\geq$ maf), if variant.id=NULL; NaN for no filter
missing.rate	threshold of missing rate (checking $\leq$ missing.rate), if variant.id=NULL; NaN for no filter
max.num.snp	the maximum number of SNPs used, or -1 for no limit
variant.id	a list of variant IDs, used to construct GRM
inv.norm	if TRUE, perform inverse normal transformation on residuals for quantitative outcomes, see the reference [Sofer, 2019]
X.transform	if TRUE, perform QR decomposition on the design matrix
tol	overall tolerance for model fitting
maxiter	the maximum number of iterations for model fitting
nrun	the number of random vectors in the trace estimation
tolPCG	tolerance of PCG iterations
maxiterPCG	the maximum number of PCG iterations
num.marker	the number of SNPs used to calculate the variance ratio
tau.init	a 2-length numeric vector, the initial values for variance components, tau; for binary traits, the first element is always be set to 1. if tau.init is not specified, the second element will be 0.5 for binary traits
traceCVcutoff	the threshold for coefficient of variation (CV) for the trace estimator, and the number of runs for trace estimation will be increased until the CV is below the threshold
ratioCVcutoff	the threshold for coefficient of variation (CV) for estimating the variance ratio, and the number of randomly selected markers will be increased until the CV is below the threshold
geno.sparse	if TRUE, store the sparse structure for genotypes; otherwise, save genotypes in a 2-bit dense matrix; see details
num.thread	the number of threads
model.savefn	the filename of model output, R data file '.rda', '.RData', or '.rds'
seed	an integer as a seed for random numbers
fork.loading	load genotypes via forking or not; forking processes in Unix can reduce loading time of genotypes, but may double the memory usage; not applicable on Windows
verbose	if TRUE, show information

## Details

Utilizing the sparse structure of genotypes could significantly improve the computational efficiency of model fitting, but it also increases the memory usage. For more details of SAIGE algorithm, please refer to the SAIGE paper [Zhou et al. 2018] (see the reference section).

**Value**

Returns a list with the following components:

<code>coefficients</code>	the beta coefficients for fixed effects;
<code>tau</code>	a numeric vector of variance components 'Sigma_E' and 'Sigma_G';
<code>linear.predictors</code>	the linear fit on link scale;
<code>fitted.values</code>	fitted values from objects returned by modeling functions using <code>glm.fit</code> ;
<code>residuals</code>	residuals;
<code>cov</code>	covariance matrix of beta coefficients;
<code>converged</code>	whether the model is fitted or not;
<code>obj.noK</code>	internal use, returned object from the SPAtest package;
<code>var.ratio</code>	a data.frame with columns 'id' (variant.id), 'maf' (minor allele frequency), 'mac' (minor allele count), 'var1' (the variance of score statistic), 'var2' (a variance estimate without accounting for estimated random effects) and 'ratio' (var1/var2, estimated variance ratio for variance approximation);
<code>trait.type</code>	either "binary" or "quantitative";
<code>sample.id</code>	the sample IDs used in the model fitting;
<code>variant.id</code>	the variant IDs used in the model fitting.

**Examples**

```
# open a GDS file
fn <- system.file("extdata", "grm1k_10k_snp.gds", package="SAIGEgds")
gdsfile <- seqOpen(fn)

# load phenotype
phenofn <- system.file("extdata", "pheno.txt.gz", package="SAIGEgds")
pheno <- read.table(phenofn, header=TRUE, as.is=TRUE)
```

```

head(pheno)

# fit the null model
glm <- seqFitNullGLMM_SPA(y ~ x1 + x2, pheno, gdsfile, trait.type="binary")
glm

# close the GDS file
seqClose(gdsfile)

```

seqGLMM\_GxG\_spa

*SNP Interaction Testing***Description**

SNP interaction testing with Saddlepoint approximation method in the mixed framework.

**Usage**

```

seqGLMM_GxG_spa(formula, data, gds_grm, gds_assoc, snp_pair,
  trait.type=c("binary", "quantitative"), sample.col="sample.id", maf=0.005,
  missing.rate=0.01, max.num.snp=1000000L, variant.id=NULL, inv.norm=TRUE,
  X.transform=TRUE, tol=0.02, maxiter=20L, nrun=30L, tolPCG=1e-5,
  maxiterPCG=500L, tau.init=c(0,0), use_approx_tau=FALSE, glm_threshold=FALSE,
  traceCVcutoff=0.0025, ratioCVcutoff=0.001, geno.sparse=TRUE, num.thread=1L,
  model.savefn="", seed=200L, fork.loading=FALSE, verbose=TRUE,
  verbose.detail=TRUE)

```

**Arguments**

formula	an object of class formula (or one that can be coerced to that class), e.g., $y \sim x1 + x2$ , see <a href="#">lm</a>
data	a data frame for the formulas
gds_grm	a SeqArray GDS filename, or a GDS object
gds_assoc	a SeqArray GDS filename, a GDS object, or a 0/1/2/NA matrix with row names for sample IDs
snp_pair	a data.frame with the first two columns for the variant IDs (i.e., 'variant.id') in gds_assoc
trait.type	"binary" for binary outcomes, "quantitative" for continuous outcomes
sample.col	the column name of sample IDs corresponding to the GDS file
maf	minor allele frequency for imported genotypes (checking $\geq$ maf), if variant.id=NULL; NaN for no filter
missing.rate	threshold of missing rate (checking $\leq$ missing.rate), if variant.id=NULL; NaN for no filter
max.num.snp	the maximum number of SNPs used in the calculation of GRM, or -1 for no limit
variant.id	a list of variant IDs, used to construct GRM

<code>inv.norm</code>	if TRUE, perform inverse normal transformation on residuals for quantitative outcomes, see the reference [Sofer, 2019]
<code>X.transform</code>	if TRUE, perform QR decomposition on the design matrix
<code>tol</code>	overall tolerance for model fitting
<code>maxiter</code>	the maximum number of iterations for model fitting
<code>nrun</code>	the number of random vectors in the trace estimation
<code>tolPCG</code>	tolerance of PCG iterations
<code>maxiterPCG</code>	the maximum number of PCG iterations
<code>tau.init</code>	a 2-length numeric vector, the initial values for variance components, tau; for binary traits, the first element is always be set to 1. if <code>tau.init</code> is not specified, the second element will be 0.5 for binary traits
<code>use_approx_tau</code>	if TRUE, fit the model defined in <code>formula</code> without any SNP markers for the interactions to provide the estimated tau value (variance component estimates)
<code>glm_threshold</code>	FALSE, TRUE or a numeric value for p-value threshold; if TRUE use 0.01 as a threshold
<code>traceCVcutoff</code>	the threshold for coefficient of variation (CV) for the trace estimator, and the number of runs for trace estimation will be increased until the CV is below the threshold
<code>ratioCVcutoff</code>	the threshold for coefficient of variation (CV) for estimating the variance ratio, and the number of randomly selected markers will be increased until the CV is below the threshold
<code>geno.sparse</code>	if TRUE, store the sparse structure for genotypes; otherwise, save genotypes in a 2-bit dense matrix; see details
<code>num.thread</code>	the number of threads
<code>model.savefn</code>	the filename of model output, R data file <code>.rda</code> , <code>.RData</code> , <code>.rds</code> , <code>.txt</code> or <code>.csv</code>
<code>seed</code>	an integer as a seed for random numbers
<code>fork.loading</code>	load genotypes via forking or not; forking processes in Unix can reduce loading time of genotypes, but may double the memory usage; not applicable on Windows
<code>verbose</code>	if TRUE, show information
<code>verbose.detail</code>	if TRUE, show the details for model fitting

## Details

For more details of SAIGE algorithm, please refer to the SAIGE paper [Zhou et al. 2018] (see the reference section).

## Value

Return a `data.frame` with the following components:

<code>id1</code>	variant ID for the first SNP in the GDS file;
<code>snp1</code>	includes chromosome, position, reference & alterative alleles for SNP1;

maf1	minor allele frequency for the first SNP;
id2	variant ID for the second SNP in the GDS file;
snp2	includes chromosome, position, reference & alternative alleles for SNP2;
maf2	minor allele frequency for the second SNP;
beta	beta coefficient, odds ratio if binary outcomes;
SE	standard error for beta coefficient;
n_nonzero	the number of non-zero values in the interaction term;
pval	adjusted p-value with the Saddlepoint approximation method;
p.norm	p-values based on asymptotic normality (could be 0 if it is too small, e.g., $\text{pnorm}(-50) = 0$ in R; used for checking only
converged	whether the SPA algorithm converges or not for adjusted p-values.
p.glm	glm p-value with SPA calculation
p.glm.norm	glm p-value without SPA calculation

**Examples**

```
# open the GDS file for genetic relationship matrix (GRM)
grm_fn <- system.file("extdata", "grm1k_10k_snp.gds", package="SAIGEgds")
(grm_gds <- seqOpen(grm_fn))

# load phenotype
phenofn <- system.file("extdata", "pheno.txt.gz", package="SAIGEgds")
pheno <- read.table(phenofn, header=TRUE, as.is=TRUE)
head(pheno)

# define the SNP pairs
snp_pair <- data.frame(s1=2:3, s2=6:7, note=c("F1", "F2"))

seqGLMM_GxG_spa(y ~ x1 + x2, pheno, grm_gds, grm_fn, snp_pair,
  trait.type="binary", verbose.detail=FALSE)
```

---

seqSAIGE\_LoadPval      *Load the association results*

---

**Description**

Load the association results from an RData, RDS or GDS file.

**Usage**

```
seqSAIGE_LoadPval(fn, varnm=NULL, index=NULL, verbose=TRUE)
```

**Arguments**

fn	RData, RDS or GDS file names, merging datasets if multiple files
varnm	NULL, or a character vector to include the column names; e.g., c("chr", "position", "rs.id", "ref", "alt", "pval")
index	NULL, or a logical/numeric vector for a set of rows
verbose	if TRUE, show information

**Value**

Return a data.frame including p-values.
