Package ‘metagenomeSeq’

December 14, 2021

Title Statistical analysis for sparse high-throughput sequencing
Version 1.36.0
Date 2019-07-12
Author Joseph Nathaniel Paulson, Nathan D. Olson, Domenick J. Braccia, Justin Wagner, Hisham Talukder, Mihai Pop, Hector Corrada Bravo
Maintainer Joseph N. Paulson <jpaulson@jimmy.harvard.edu>
Description metagenomeSeq is designed to determine features (be it Operational Taxonomic Unit (OTU), species, etc.) that are differentially abundant between two or more groups of multiple samples. metagenomeSeq is designed to address the effects of both normalization and under-sampling of microbial communities on disease association detection and the testing of feature correlations.

**metagenomeSeq-package**  
*Statistical analysis for sparse high-throughput sequencing*

**Description**

metagenomeSeq is designed to determine features (be it Operational Taxonomic Unit (OTU), species, etc.) that are differentially abundant between two or more groups of multiple samples. metagenomeSeq is designed to address the effects of both normalization and under-sampling of microbial communities on disease association detection and the testing of feature correlations. A user's guide is available, and can be opened by typing `vignette("metagenomeSeq")`

The metagenomeSeq package implements novel normalization and statistical methodology in the following papers.

**Author(s)**

Paulson, JN <jpaulson@umiacs.umd.edu>; Pop, M; Corrada Bravo, H

**References**

---

**aggregateBySample**  
*Aggregates a MRexperiment object or counts matrix to by a factor.*

**Description**

Using the phenoData information in the MRexperiment, calling aggregateBySample on a MRexperiment and a particular phenoData column (i.e. 'diet') will aggregate counts using the `aggfun` function (default `rowMeans`). Possible `aggfun` alternatives include `rowMeans` and `rowMedians`.

**Usage**

```r
aggregateBySample(obj, fct, aggfun = rowMeans, out = "MRexperiment")
aggSamp(obj, fct, aggfun = rowMeans, out = "MRexperiment")
```

**Arguments**

- `obj`: A MRexperiment object or count matrix.
- `fct`: phenoData column name from the MRexperiment object or if count matrix object a vector of labels.
- `aggfun`: Aggregation function.
- `out`: Either 'MRexperiment' or 'matrix'
aggregateByTaxonomy

Value

An aggregated count matrix or MRexperiment object where the new pData is a vector of ‘fct’ levels.

Examples

data(mouseData)
aggregateBySample(mouseData[1:100,],fct="diet",aggfun=rowSums)
# not run
# aggregateBySample(mouseData,fct="diet",aggfun=matrixStats::rowMedians)
# aggSamp(mouseData,fct='diet',aggfun=rowMaxs)

aggregateByTaxonomy  Aggregates a MRexperiment object or counts matrix to a particular level.

Description

Using the featureData information in the MRexperiment, calling aggregateByTaxonomy on a MRexperiment and a particular featureData column (i.e. 'genus') will aggregate counts to the desired level using the aggfun function (default colSums). Possible aggfun alternatives include colMeans and colMedians.

Usage

aggregateByTaxonomy(
  obj,
  lvl,
  alternate = FALSE,
  norm = FALSE,
  log = FALSE,
  aggfun = colSums,
  sl = 1000,
  featureOrder = NULL,
  returnFullHierarchy = TRUE,
  out = "MRexperiment"
)

aggTax(
  obj,
  lvl,
  alternate = FALSE,
  norm = FALSE,
  log = FALSE,
  aggfun = colSums,
  sl = 1000,
  featureOrder = NULL,
Arguments

obj  A MRexperiment object or count matrix.
lvl  featureData column name from the MRexperiment object or if count matrix object a vector of labels.
alternate  Use the rowname for undefined OTUs instead of aggregating to "no_match".
norm  Whether to aggregate normalized counts or not.
log  Whether or not to log2 transform the counts - if MRexperiment object.
aggfun  Aggregation function.
sl  scaling value, default is 1000.
featureOrder  Hierarchy of levels in taxonomy as fData colnames
returnFullHierarchy  Boolean value to indicate return single column of fData or all columns of hierarchy
out  Either 'MRexperiment' or 'matrix'

Value

An aggregated count matrix.

Examples

data(mouseData)
aggregateByTaxonomy(mouseData[1:100,],lvl="class",norm=TRUE,aggfun=colSums)
# not run
# aggregateByTaxonomy(mouseData,lvl="class",norm=TRUE,aggfun=colMedians)
# aggTax(mouseData,lvl='phylum',norm=FALSE,aggfun=colSums)

biom2MRexperiment  Biom to MRexperiment objects

Description

Wrapper to convert biom files to MRexperiment objects.

Usage

biom2MRexperiment(obj)
calcNormFactors

Arguments

obj The biom object file.

Value

A MRexperiment object.

See Also

loadMeta loadPhenoData newMRexperiment loadBiom

Examples

library(biomformat)
rich_dense_file = system.file("extdata", "rich_dense_otu_table.biom", package = "biomformat")
x = biomformat::read_biom(rich_dense_file)
biom2MRexperiment(x)

calcNormFactors

Cumulative sum scaling (css) normalization factors

Description

Return a vector of the sum up to and including a quantile.

Usage

calcNormFactors(obj, p = cumNormStatFast(obj))

Arguments

obj An MRexperiment object or matrix.

p The pth quantile.

Value

Vector of the sum up to and including a sample’s pth quantile.

See Also

fitZig cumNormStatFast cumNorm

Examples

data(mouseData)
head(calcNormFactors(mouseData))
calcPosComponent  

*Positive component*

**Description**

Fit the positive (log-normal) component

**Usage**

```r
calcPosComponent(mat, mod, weights)
```

**Arguments**

- `mat`: A matrix of normalized counts
- `mod`: A model matrix
- `weights`: Weight matrix for samples and counts

**See Also**

- `fitZeroLogNormal`
- `fitFeatureModel`

---

calcShrinkParameters  

*Calculate shrinkage parameters*

**Description**

Calculate the shrunken variances and variance of parameters of interest across features.

**Usage**

```r
calcShrinkParameters(fit, coef, mins2, exclude = NULL)
```

**Arguments**

- `fit`: A matrix of fits as outputted by `calcZeroComponent` or `calcPosComponent`
- `coef`: Coefficient of interest
- `mins2`: minimum variance estimate
- `exclude`: Vector of features to exclude when shrinking

**See Also**

- `fitZeroLogNormal`
- `fitFeatureModel`
**calcStandardError**

*Calculate the zero-inflated log-normal statistic's standard error*

**Description**

Calculate the se for the model. Code modified from "Adjusting for covariates in zero-inflated gamma and zero-inflated log-normal models for semicontinuous data", ED Mills

**Usage**

```r
calcStandardError(mod, fitln, fitzero, coef = 2, exclude = NULL)
```

**Arguments**

- `mod`: The zero component model matrix
- `fitln`: A matrix with parameters from the log-normal fit
- `fitzero`: A matrix with parameters from the logistic fit
- `coef`: Coefficient of interest
- `exclude`: List of features to exclude

**See Also**

- `fitZeroLogNormal`
- `fitFeatureModel`

**calculateEffectiveSamples**

*Estimated effective samples per feature*

**Description**

Calculates the number of estimated effective samples per feature from the output of a fitZig run. The estimated effective samples per feature is calculated as the sum_1^n (n = number of samples) 1-z_i where z_i is the posterior probability a feature belongs to the technical distribution.

**Usage**

```r
calculateEffectiveSamples(obj)
```

**Arguments**

- `obj`: The output of fitZig run on a MReperiment object.

**Value**

A list of the estimated effective samples per feature.
calcZeroComponent

See Also

fitZig MRcoefs MRfulltable

calcZeroAdjustment  Calculate the zero-inflated component's adjustment factor

Description

Calculate the log ratio of average marginal probabilities for each sample having a positive count. This becomes the adjustment factor for the log fold change.

Usage

calcZeroAdjustment(fitln, fitzero, mod, coef, exclude = NULL)

Arguments

fitln  A matrix with parameters from the log-normal fit
fitzero A matrix with parameters from the logistic fit
mod    The zero component model matrix
coef   Coefficient of interest
exclude List of features to exclude

See Also

fitZeroLogNormal fitFeatureModel

calcZeroComponent  Zero component

Description

Fit the zero (logistic) component

Usage

calcZeroComponent(mat, mod, weights)

Arguments

mat       A matrix of normalized counts
mod       A model matrix
weights   Weight matrix for samples and counts

See Also

fitZeroLogNormal fitFeatureModel
correctIndices

Calculate the correct indices for the output of correlationTest

Description

Consider the upper triangular portion of a matrix of size nxn. Results from the correlationTest are output as the combination of two vectors, correlation statistic and p-values. The order of the output is 1vs2, 1vs3, 1vs4, etc. The correctIndices returns the correct indices to fill a correlation matrix or correlation-pvalue matrix.

Usage

correctIndices(n)

Arguments

n The number of features compared by correlationTest (nrow(mat)).

Value

A vector of the indices for an upper triangular matrix.

See Also

correlationTest

Examples

data(mouseData)
mat = MRcounts(mouseData)[55:60,]
cors = correlationTest(mat)
ind = correctIndices(nrow(mat))

cormat = as.matrix(dist(mat))
cormat[cormat>0] = 0
cormat[upper.tri(cormat)][ind] = cors[,1]
table(cormat[1,-1] - cors[1:5,1])
correlationTest  

**Correlation of each row of a matrix or MRexperiment object**

**Description**

Calculates the (pairwise) correlation statistics and associated p-values of a matrix or the correlation of each row with a vector.

**Usage**

```r
correlationTest(
  obj, 
  y = NULL, 
  method = "pearson", 
  alternative = "two.sided", 
  norm = TRUE, 
  log = TRUE, 
  cores = 1, 
  override = FALSE, 
  ...
)
```

**Arguments**

- `obj`  
  A MRexperiment object or count matrix.
- `y`  
  Vector of length `ncol(obj)` to compare to.
- `method`  
  One of 'pearson', 'spearman', or 'kendall'.
- `alternative`  
  Indicates the alternative hypothesis and must be one of 'two.sided', 'greater' (positive) or 'less'(negative). You can specify just the initial letter.
- `norm`  
  Whether to aggregate normalized counts or not - if MRexperiment object.
- `log`  
  Whether or not to log2 transform the counts - if MRexperiment object.
- `cores`  
  Number of cores to use.
- `override`  
  If the number of rows to test is over a thousand the test will not commence (unless override==TRUE).
- `...`  
  Extra parameters for mclapply.

**Value**

A matrix of size `choose(number of rows, 2)` by 2. The first column corresponds to the correlation value. The second column the p-value.

**See Also**

- `correctIndices`
Examples

# Pairwise correlation of raw counts
data(mouseData)
cors = correlationTest(mouseData[1:10,], norm=FALSE, log=FALSE)
head(cors)

mat = MRcounts(mouseData)[1:10,]
cormat = as.matrix(dist(mat)) # Creating a matrix
cormat[cormat>0] = 0 # Creating an empty matrix
ind = correctIndices(nrow(mat))
cormat[upper.tri(cormat)][ind] = cors[,1]
table(cormat[1,-1] - cors[1:9,1])

# Correlation of raw counts with a vector (library size in this case)
data(mouseData)
cors = correlationTest(mouseData[1:10,], libSize(mouseData), norm=FALSE, log=FALSE)
head(cors)

cumNorm

Cumulative sum scaling normalization

Description

Calculates each column’s quantile and calculates the sum up to and including that quantile.

Usage

cumNorm(obj, p = cumNormStatFast(obj))

Arguments

obj An MRexperiment object.
p The pth quantile.

Value

Object with the normalization factors stored as a vector of the sum up to and including a sample’s pth quantile.

See Also

fitZig cumNormStat

Examples

data(mouseData)
mouseData <- cumNorm(mouseData)
head(normFactors(mouseData))
### cumNormMat

**Cumulative sum scaling factors.**

**Description**

Calculates each column’s quantile and calculates the sum up to and including that quantile.

**Usage**

```r
cumNormMat(obj, p = cumNormStatFast(obj), sl = 1000)
```

**Arguments**

- `obj`: A matrix or MRexperiment object.
- `p`: The pth quantile.
- `sl`: The value to scale by (default=1000).

**Value**

Returns a matrix normalized by scaling counts up to and including the pth quantile.

**See Also**

`fitZig` `cumNorm`

**Examples**

```r
data(mouseData)
head(cumNormMat(mouseData))
```

### cumNormStat

**Cumulative sum scaling percentile selection**

**Description**

Calculates the percentile for which to sum counts up to and scale by. `cumNormStat` might be deprecated one day. Deviates from methods in Nature Methods paper by making use row means for generating reference.

**Usage**

```r
cumNormStat(obj, qFlag = TRUE, pFlag = FALSE, rel = 0.1, ...)
```

**See Also**

`fitZig` `cumNorm`
cumNormStatFast

Arguments

obj A matrix or MRexperiment object.
qFlag Flag to either calculate the proper percentile using R’s step-wise quantile function or approximate function.
pFlag Plot the relative difference of the median deviance from the reference.
rel Cutoff for the relative difference from one median difference from the reference to the next
... Applicable if pFlag == TRUE. Additional plotting parameters.

Value

Percentile for which to scale data

See Also

fitZig cumNorm cumNormStatFast

Examples

data(mouseData)
p = round(cumNormStat(mouseData,pFlag=FALSE),digits=2)

cumNormStatFast

Cumulative sum scaling percentile selection

Description

Calculates the percentile for which to sum counts up to and scale by. Faster version than available in cumNormStat. Deviates from methods described in Nature Methods by making use of ro means for reference.

Usage

cumNormStatFast(obj, pFlag = FALSE, rel = 0.1, ...)

Arguments

obj A matrix or MRexperiment object.
pFlag Plot the median difference quantiles.
rel Cutoff for the relative difference from one median difference from the reference to the next.
... Applicable if pFlag == TRUE. Additional plotting parameters.
Value

Percentile for which to scale data

See Also

fitZig cumNorm cumNormStat

Examples

data(mouseData)
p = round(cumNormStatFast(mouseData,pFlag=FALSE),digits=2)

doceCountMStep

Compute the Maximization step calculation for features still active.

Description

Maximization step is solved by weighted least squares. The function also computes counts residuals.

Usage

doCountMStep(z, y, mmCount, stillActive, fit2 = NULL, dfMethod = "modified")

Arguments

z
Matrix (m x n) of estimate responsibilities (probabilities that a count comes from a spike distribution at 0).

y
Matrix (m x n) of count observations.

mmCount
Model matrix for the count distribution.

stillActive
Boolean vector of size M, indicating whether a feature converged or not.

fit2
Previous fit of the count model.

dfMethod
Either 'default' or 'modified' (by responsibilities)

Details

Maximum-likelihood estimates are approximated using the EM algorithm where we treat mixture membership $\delta_{ij} = 1$ if $y_{ij}$ is generated from the zero point mass as latent indicator variables. The density is defined as $f_{zig}(y_{ij} = \pi_j(S_j)*f_0(y_{ij}) +(1-\pi_j (S_j)) * f_{count}(y_{ij};\mu_i, \sigma_i^2)$. The log-likelihood in this extended model is $(1-\delta_{ij}) \log f_{count}(y_{ij};\mu_i, \sigma_i^2 ) +\delta_{ij} \log \pi_j(s_j)+(1-\delta_{ij})\log (1-\pi_j (s_j))$. The responsibilities are defined as $z_{ij} = pr(\delta_{ij}=1 | data)$.
doEStep

Value

Update matrix (m x n) of estimate responsibilities (probabilities that a count comes from a spike distribution at 0).

See Also

fitZig

Description

Estimates the responsibilities \( z_{ij} = \frac{\pi_j}{I_0(y_{ij}) \pi_j \cdot I_0(y_{ij}) + (1 - \pi_j) \cdot f_{count}(y_{ij})} \).

Usage

doEStep(countResiduals, zeroResiduals, zeroIndices)

Arguments

- countResiduals: Residuals from the count model.
- zeroResiduals: Residuals from the zero model.
- zeroIndices: Index (matrix m x n) of counts that are zero/non-zero.

Details

Maximum-likelihood estimates are approximated using the EM algorithm where we treat mixture membership \( \delta_{ij} = 1 \) if \( y_{ij} \) is generated from the zero point mass as latent indicator variables. The density is defined as \( f_{zig}(y_{ij} = \pi_j(S_j) \cdot f_0(y_{ij}) + (1 - \pi_j(S_j)) \cdot f_{count}(y_{ij};\mu_i,\sigma_i^2) \). The log-likelihood in this extended model is \( \log f_{count}(y_{ij};\mu_i,\sigma_i^2) + \delta_{ij} \log \pi_j(s_j) + (1 - \delta_{ij}) \log (1 - \pi_j(s_j)) \). The responsibilities are defined as \( z_{ij} = pr(\delta_{ij} = 1 | data) \).

Value

Updated matrix (m x n) of estimate responsibilities (probabilities that a count comes from a spike distribution at 0).

See Also

fitZig
doZeroMStep  

*Compute the zero Maximization step.*

**Description**

Performs Maximization step calculation for the mixture components. Uses least squares to fit the parameters of the mean of the logistic distribution. $\pi_j = \sum_{i} \frac{1}{M} z_{ij}$ Maximum-likelihood estimates are approximated using the EM algorithm where we treat mixture membership $\delta_{ij} = 1$ if $y_{ij}$ is generated from the zero point mass as latent indicator variables. The density is defined as $f_z(y_{ij} = \pi_j(S_j)) \cdot f_0(y_{ij}) + (1-\pi_j(S_j)) \cdot f_{\text{count}}(y_{ij}; \mu_i, \sigma_i^2)$. The log-likelihood in this extended model is $(1-\delta_{ij}) \log f_{\text{count}}(y; \mu_i, \sigma_i^2) + \delta_{ij} \log \pi_j(S_j) + (1-\delta_{ij}) \log (1-\pi_j(S_j))$. The responsibilities are defined as $z_{ij} = \Pr(\delta_{ij}=1 \mid data)$.

**Usage**

`doZeroMStep(z, zeroIndices, mmZero)`

**Arguments**

- `z`: Matrix (m x n) of estimate responsibilities (probabilities that a count comes from a spike distribution at 0).
- `zeroIndices`: Index (matrix m x n) of counts that are zero/non-zero.
- `mmZero`: The zero model, the model matrix to account for the change in the number of OTUs observed as a linear effect of the depth of coverage.

**Value**

List of the zero fit (zero mean model) coefficients, variance - scale parameter (scalar), and normalized residuals of length `sum(zeroIndices)`.

**See Also**

`fitZig`

---

**exportMat**

*Export the normalized MRexperiment dataset as a matrix.*

**Description**

This function allows the user to take a dataset of counts and output the dataset to the user's workspace as a tab-delimited file, etc.
Usage

exportMat(
  obj,
  log = TRUE,
  norm = TRUE,
  sep = "\t",
  file = "~/Desktop/matrix.tsv"
)

Arguments

obj A MRexperiment object or count matrix.
log Whether or not to log transform the counts - if MRexperiment object.
norm Whether or not to normalize the counts - if MRexperiment object.
sep Separator for writing out the count matrix.
file Output file name.

Value

NA

See Also

cumNorm

Examples

data(lungData)
dataDirectory <- system.file("extdata", package="metagenomeSeq")
exportMat(lungData[,1:5],file=file.path(dataDirectory,"tmp.tsv"))
head(read.csv(file=file.path(dataDirectory,"tmp.tsv"),sep="\t"))

---

exportStats Various statistics of the count data.

Description

A matrix of values for each sample. The matrix consists of sample ids, the sample scaling factor, quantile value, the number identified features, and library size (depth of coverage).

Usage

exportStats(obj, p = cumNormStat(obj), file = "~/Desktop/res.stats.tsv")
expSummary

Arguments

- **obj**: A MRexperiment object with count data.
- **p**: Quantile value to calculate the scaling factor and quantiles for the various samples.
- **file**: Output file name.

Value

None.

See Also

cumNorm quantile

Examples

data(lungData)
dataDirectory <- system.file("extdata", package="metagenomeSeq")
exportStats(lungData[,1:5],file=file.path(dataDirectory,"tmp.tsv"))
head(read.csv(file=file.path(dataDirectory,"tmp.tsv"),sep="\t"))

---

expSummary Access MRexperiment object experiment data

Description

The expSummary vectors represent the column (sample specific) sums of features, i.e. the total number of reads for a sample, libSize and also the normalization factors, normFactor.

Usage

expSummary(obj)

Arguments

- **obj**: a MRexperiment object.

Value

Experiment summary table

Author(s)

Joseph N. Paulson, j paulson@umiacs.umd.edu
**extractMR**

*Extract the essentials of an MRexperiment.*

**Description**

Extract the essentials of an MRexperiment.

**Usage**

```
extractMR(obj)
```

**Arguments**

- **obj**: MRexperiment-class object.

**Value**

A list containing:

- **counts**: Count data
- **librarySize**: The column sums / library size / sequencing depth
- **normFactors**: The normalization scaling factors
- **pheno**: phenotype table
- **feat**: feature table

**Examples**

```r
data(mouseData)
expSummary(mouseData)
```

```r
data(mouseData)
head(metagenomeSeq:::extractMR(mouseData))
```
filterData

Filter datasets according to no. features present in features with at least a certain depth.

Description

Filter the data based on the number of present features after filtering samples by depth of coverage. There are many ways to filter the object, this is just one way.

Usage

`filterData(obj, present = 1, depth = 1000)`

Arguments

- `obj` A MRexperiment object or count matrix.
- `present` Features with at least 'present' positive samples.
- `depth` Samples with at least this much depth of coverage

Value

A MRexperiment object.

Examples

```
data(mouseData)
filterData(mouseData)
```

fitDO

Wrapper to calculate Discovery Odds Ratios on feature values.

Description

This function returns a data frame of p-values, odds ratios, lower and upper confidence limits for every row of a matrix. The discovery odds ratio is calculated as using Fisher’s exact test on actual counts. The test’s hypothesis is whether or not the discovery of counts for a feature (of all counts) is found in greater proportion in a particular group.

Usage

`fitDO(obj, cl, norm = TRUE, log = TRUE, adjust.method = "fdr", cores = 1, ...)`
fitFeatureModel

Computes differential abundance analysis using a zero-inflated log-normal model

Description

Wrapper to actually run zero-inflated log-normal model given a MRexperiment object and model matrix. User can decide to shrink parameter estimates.

Usage

fitFeatureModel(obj, mod, coef = 2, B = 1, szero = FALSE, spos = TRUE)
Arguments

- **obj**: A MRexperiment object with count data.
- **mod**: The model for the count distribution.
- **coef**: Coefficient of interest to grab log fold-changes.
- **B**: Number of bootstraps to perform if >1. If >1 performs permutation test.
- **szero**: TRUE/FALSE, shrink zero component parameters.
- **spos**: TRUE/FALSE, shrink positive component parameters.

Value

A list of objects including:

- `call`: the call made to fitFeatureModel
- `fitZeroLogNormal`: list of parameter estimates for the zero-inflated log normal model
- `design`: model matrix
- `taxa`: taxa names
- `counts`: count matrix
- `pvalues`: calculated p-values
- `permuttedfits`: permutted z-score estimates under the null

See Also

`cumNorm`

Examples

```r
data(lungData)
lungData = lungData[, -which(is.na(pData(lungData)$SmokingStatus))]
lungData = filterData(lungData, present = 30, depth = 1)
lungData <- cumNorm(lungData, p = .5)
s <- normFactors(lungData)
pd <- pData(lungData)
mod <- model.matrix(~ 1 + SmokingStatus, data = pd)
lungres1 = fitFeatureModel(lungData, mod)
```

---

**Description**

This class contains all of the same information expected from a fitFeatureModel call, but it is defined in the S4 style as opposed to being stored as a list.
fitLogNormal

Slots

call  the call made to fitFeatureModel
fitZeroLogNormal  list of parameter estimates for the zero-inflated log normal model
design  model matrix
taxa  taxa names
counts  count matrix
pvalues  calculated p-values
permuttedFits  permuted z-score estimates under the null

Description

Wrapper to perform the permutation test on the t-statistic. This is the original method employed by metastats (for non-sparse large samples). We include CSS normalization though (optional) and log2 transform the data. In this method the null distribution is not assumed to be a t-dist.

Usage

fitLogNormal(obj, mod, useCSSoffset = TRUE, B = 1000, coef = 2, sl = 1000)

Arguments

obj  A MRexperiment object with count data.
mod  The model for the count distribution.
useCSSoffset  Boolean, whether to include the default scaling parameters in the model or not.
B  Number of permutations.
coef  The coefficient of interest.
sl  The value to scale by (default=1000).

Value

Call made, fit object from lmFit, t-statistics and p-values for each feature.

Examples

# This is a simple demonstration
data(lungData)
k = grep("Extraction.Control",pData(lungData)$SampleType)
lungTrim = lungData[-k]
k = which(rowSums(MRcounts(lungTrim)>0)<30)
lungTrim = cumNorm(lungTrim)
lungTrim = lungTrim[-k,]
smokingStatus = pData(lungTrim)$SmokingStatus
mod = model.matrix(~smokingStatus)
fit = fitLogNormal(obj = lungTrim,mod=mod,B=1)

fitMultipleTimeSeries  Discover differentially abundant time intervals for all bacteria

Description

Calculate time intervals of significant differential abundance over all bacteria of a particularly specified level (lvl). If not lvl is specified, all OTUs are analyzed. Warning, function can take a while

Usage

fitMultipleTimeSeries(obj, lvl = NULL, B = 1, featureOrder = NULL, ...)

Arguments

obj metagenomeSeq MRexperiment-class object.
lvl Vector or name of column in featureData of MRexperiment-class object for aggregating counts (if not OTU level).
B Number of permutations to perform.
featureOrder Hierarchy of levels in taxonomy as fData colnames
... Options for fitTimeSeries, except feature.

Value

List of lists of matrices of time point intervals of interest, Difference in abundance area and p-value, fit, area permutations.

A list of lists for which each includes:

- timeIntervals - Matrix of time point intervals of interest, area of differential abundance, and pvalue.
- data - Data frame of abundance, class indicator, time, and id input.
- fit - Data frame of fitted values of the difference in abundance, standard error estimates and timepoints interpolated over.
- perm - Differential abundance area estimates for each permutation.
- call - Function call.

See Also

cumNorm fitSSTimeSeries fitTimeSeries
fitPA

Wrapper to run fisher's test on presence/absence of a feature.

Description

This function returns a data frame of p-values, odds ratios, lower and upper confidence limits for every row of a matrix.

Usage

fitPA(obj, cl, thres = 0, adjust.method = "fdr", cores = 1, ...)

Arguments

obj       A MRexperiment object with a count matrix, or a simple count matrix.
cl       Group comparison
thres     Threshold for defining presence/absence.
adjust.method Method to adjust p-values by. Default is "FDR". Options include "holm", "hochberg", "hommel", "bonferroni", "BH", "BY", "fdr", "none". See p.adjust for more details.
cores     Number of cores to use.
...       Extra parameters for makeCluster

Value

Matrix of odds ratios, p-values, lower and upper confidence intervals

res = fitPA(lungTrim,pData(lungTrim)$SmokingStatus);
head(res)
**fitSSTimeSeries**

*Discover differentially abundant time intervals using SS-Anova*

**Description**

Calculate time intervals of interest using SS-Anova fitted models. Fitting is performed uses Smoothing Spline ANOVA (SS-Anova) to find interesting intervals of time. Given observations at different time points for two groups, fitSSTimeSeries calculates a function that models the difference in abundance between two groups across all time. Using permutations we estimate a null distribution of areas for the time intervals of interest and report significant intervals of time. Use of the function for analyses should cite: "Finding regions of interest in high throughput genomics data using smoothing splines" Talukder H, Paulson JN, Bravo HC. (In preparation)

**Usage**

```r
fitSSTimeSeries(
  obj,
  formula,
  feature,
  class,
  time,
  id,
  lvl = NULL,
  include = c("class", "time:class"),
  C = 0,
  B = 1000,
  norm = TRUE,
  log = TRUE,
  sl = 1000,
  featureOrder = NULL,
  ...
)
```

**Arguments**

- `obj`: metagenomeSeq MRexperiment-class object.
- `formula`: Formula for ssanova. Of the form: abundance ~ ... where ... includes any pData slot value.
- `feature`: Name or row of feature of interest.
- `class`: Name of column in phenoData of MRexperiment-class object for class membership.
- `time`: Name of column in phenoData of MRexperiment-class object for relative time.
- `id`: Name of column in phenoData of MRexperiment-class object for sample id.
- `lvl`: Vector or name of column in featureData of MRexperiment-class object for aggregating counts (if not OTU level).
**fitTimeSeries**

**Description**

Calculate time intervals of significant differential abundance. Currently only one method is implemented (ssanova). fitSSTimeSeries is called with method="ssanova".

**Value**

List of matrix of time point intervals of interest, Difference in abundance area and p-value, fit, area permutations, and call.

A list of objects including:

- **timeIntervals** - Matrix of time point intervals of interest, area of differential abundance, and p-value.
- **data** - Data frame of abundance, class indicator, time, and id input.
- **fit** - Data frame of fitted values of the difference in abundance, standard error estimates and timepoints interpolated over.
- **perm** - Differential abundance area estimates for each permutation.
- **call** - Function call.

**See Also**

**Examples**

data(mouseData)
res = fitSSTimeSeries(obj=mouseData,feature="Actinobacteria", class="status",id="mouseID",time="relativeTime",lvl='class',B=2)
Usage

fitTimeSeries(
    obj,
    formula,
    feature,
    class,
    time,
    id,
    method = c("ssanova"),
    lvl = NULL,
    include = c("class", "time:class"),
    C = 0,
    B = 1000,
    norm = TRUE,
    log = TRUE,
    sl = 1000,
    featureOrder = NULL,
    ...
)

Arguments

  obj       metagenomeSeq MRexperiment-class object.
  formula   Formula for ssanova. Of the form: abundance ~ ... where ... includes any pData
              slot value.
  feature   Name or row of feature of interest.
  class     Name of column in phenoData of MRexperiment-class object for class membership.
  time      Name of column in phenoData of MRexperiment-class object for relative time.
  id        Name of column in phenoData of MRexperiment-class object for sample id.
  method    Method to estimate time intervals of differentially abundant bacteria (only ssanova
              method implemented currently).
  lvl       Vector or name of column in featureData of MRexperiment-class object for aggregating
              counts (if not OTU level).
  include   Parameters to include in prediction.
  C         Value for which difference function has to be larger or smaller than (default 0).
  B         Number of permutations to perform.
  norm      When aggregating counts to normalize or not.
  log       Log2 transform.
  sl        Scaling value.
  featureOrder  Hierarchy of levels in taxonomy as fData colnames
  ...        Options for ssanova
Value

List of matrix of time point intervals of interest, Difference in abundance area and p-value, fit, area permutations, and call.

A list of objects including:

- `timeIntervals` - Matrix of time point intervals of interest, area of differential abundance, and p-value.
- `data` - Data frame of abundance, class indicator, time, and id input.
- `fit` - Data frame of fitted values of the difference in abundance, standard error estimates and timepoints interpolated over.
- `perm` - Differential abundance area estimates for each permutation.
- `call` - Function call.

See Also

cumNorm fitSSTimeSeries plotTimeSeries

Examples

data(mouseData)
res = fitTimeSeries(obj=mouseData,feature="Actinobacteria", class="status",id="mouseID",time="relativeTime",lvl='class',B=2)
Value
A list of objects including:

- logFC - the log fold-change estimates
- adjFactor - the adjustment factor based on the zero component
- se - standard error estimates
- fitln - parameters from the log-normal fit
- fitzero - parameters from the logistic fit
- zeroRidge - output from the ridge regression
- posRidge - output from the ridge regression
- tauPos - estimated $\tau^2$ for positive component
- tauZero - estimated $\tau^2$ for zero component
- exclude - features to exclude for various reasons, e.g. all zeros
- zeroExclude - features to exclude for various reasons, e.g. all zeros

See Also

cumNorm fitFeatureModel

---

**fitZig**

 Computes the weighted fold-change estimates and t-statistics.

Description

Wrapper to actually run the Expectation-maximization algorithm and estimate $f_{count}$ fits. Maximum-likelihood estimates are approximated using the EM algorithm where we treat mixture membership $\delta_{ij} = 1$ if $y_{ij}$ is generated from the zero point mass as latent indicator variables. The density is defined as $f_{zig}(y_{ij} = \pi_j(s_j) * f_0(y_{ij}) + (1-\pi_j(s_j)) * f_{count}(y_{ij}; mu_i, sigma_i^2))$. The log-likelihood in this extended model is: $(1-\delta_{ij}) log f_{count}(y_{ij}; mu_i, sigma_i^2) + \delta_{ij} log \pi_j(s_j) + (1-\delta_{ij}) log (1-\pi_j(s_j))$. The responsibilities are defined as $z_{ij} = pr(\delta_{ij}=1 | data)$.

Usage

```r
fitZig(
  obj, 
  mod, 
  zeroMod = NULL, 
  useCSSoffset = TRUE, 
  control = zigControl(), 
  useMixedModel = FALSE, 
  ...
)
```
Arguments

- **obj**: A MRexperiment object with count data.
- **mod**: The model for the count distribution.
- **zeroMod**: The zero model, the model to account for the change in the number of OTUs observed as a linear effect of the depth of coverage.
- **useCSSoffset**: Boolean, whether to include the default scaling parameters in the model or not.
- **control**: The settings for fitZig.
- **useMixedModel**: Estimate the correlation between duplicate features or replicates using duplicateCorrelation.
- **...**: Additional parameters for duplicateCorrelation.

Value

A list of objects including:

- `call`: the call made to fitZig
- `fit`: 'MLArrayLM' Limma object of the weighted fit
- `countResiduals`: standardized residuals of the fit
- `z`: matrix of the posterior probabilities
- `eb`: output of eBayes, moderated t-statistics, moderated F-statistics, etc
- `taxa`: vector of the taxa names
- `counts`: the original count matrix input
- `zeroMod`: the zero model matrix
- `zeroCoef`: the zero model fitted results
- `stillActive`: convergence
- `stillActiveNLL`: nll at convergence
- `dupcor`: correlation of duplicates

See Also

- `cumNorm`
- `zigControl`

Examples

```r
# This is a simple demonstration
data(lungData)
k = grep("Extraction.Control", pData(lungData)$SampleType)
lungTrim = lungData[, -k]
k = which(rowSums(MRcounts(lungTrim) > 0) < 30)
lungTrim = cumNorm(lungTrim)
lungTrim = lungTrim[-k,]
smokingStatus = pData(lungTrim)$SmokingStatus
mod = model.matrix(~ smokingStatus)
# The maxit is not meant to be 1 - this is for demonstration/speed
settings = zigControl(maxit = 1, verbose = FALSE)
fit = fitZig(obj = lungTrim, mod = mod, control = settings)
```
fitZigResults-class

Class “fitZigResults” – a formal class for storing results from a fitZig call

Description

This class contains all of the same information expected from a fitZig call, but it is defined in the S4 style as opposed to being stored as a list.

Slots

call the call made to fitZig
fit 'MLArrayLM' Limma object of the weighted fit
countResiduals  standardised residuals of the fit
z matrix of the posterior probabilities. It is defined as $z_{ij} = \Pr(\delta_{ij}=1 \mid \text{data})$
zUsed used in getZ
eb output of eBayes, moderated t-statistics, moderated F-statistics, etc
taxa vector of the taxa names
counts the original count matrix input
zeroMod the zero model matrix
zeroCoef the zero model fitted results
stillActive convergence
stillActiveNLL nll at convergence
dupcor correlation of duplicates

g getCountDensity

Compute the value of the count density function from the count model residuals.

Description

Calculate density values from a normal: $f(x) = \frac{1}{\sqrt{2 \pi \sigma}} e^{-\frac{(x - \mu)^2}{2 \sigma^2}}$. Maximum-likelihood estimates are approximated using the EM algorithm where we treat mixture membership $\delta_{ij} = 1$ if $y_{ij}$ is generated from the zero point mass as latent indicator variables. The density is defined as $f_{\text{zig}}(y_{ij} = \pi_j(S_j) \cdot f_0(y_{ij}) + (1-\pi_j(S_j)) \cdot f_{\text{count}}(y_{ij};\mu_i,\sigma_i^2)$. The log-likelihood in this extended model is $(1-\delta_{ij}) \log f_{\text{count}}(y_{ij};\mu_i,\sigma_i^2) + \delta_{ij} \log \pi_j(S_j) + (1-\delta_{ij}) \log (1-\pi_j(S_j))$. The responsibilities are defined as $z_{ij} = \Pr(\delta_{ij}=1 \mid \text{data})$.

Usage

g getCountDensity(residuals, log = FALSE)
**getEpsilon**

**Arguments**

- residuals: Residuals from the count model.
- log: Whether or not we are calculating from a log-normal distribution.

**Value**

Density values from the count model residuals.

**See Also**

fitZig

---

**getEpsilon**

Calculate the relative difference between iterations of the negative log-likelihoods.

**Description**

Maximum-likelihood estimates are approximated using the EM algorithm where we treat mixture membership \( \delta_{ij} = 1 \) if \( y_{ij} \) is generated from the zero point mass as latent indicator variables. The log-likelihood in this extended model is \( (1-\delta_{ij}) \log f_{\text{count}}(y; \mu_i, \sigma_i^2) + \delta_{ij} \log \pi_j(s_j) + (1-\delta_{ij}) \log (1-\pi_j(s_j)) \). The responsibilities are defined as \( z_{ij} = \Pr(\delta_{ij}=1 | \text{data}) \).

**Usage**

gEpsion(nll, nllOld)

**Arguments**

- nll: Vector of size M with the current negative log-likelihoods.
- nllOld: Vector of size M with the previous iterations negative log-likelihoods.

**Value**

Vector of size M of the relative differences between the previous and current iteration nll.

**See Also**

fitZig
getNegativeLogLikelihoods

*Calculate the negative log-likelihoods for the various features given the residuals.*

**Description**

Maximum-likelihood estimates are approximated using the EM algorithm where we treat mixture membership $\delta_{ij} = 1$ if $y_{ij}$ is generated from the zero point mass as latent indicator variables. The log-likelihood in this extended model is $(1-\delta_{ij}) \log f_{\text{count}}(y; \mu_i, \sigma_i^2) + \delta_{ij} \log \pi_j(s_j) + (1-\delta_{ij}) \log (1-\pi_j(s_j))$. The responsibilities are defined as $z_{ij} = \Pr(\delta_{ij} = 1 \mid \text{data and current values})$.

**Usage**

`getNegativeLogLikelihoods(z, countResiduals, zeroResiduals)`

**Arguments**

- **z**: Matrix (m x n) of estimate responsibilities (probabilities that a count comes from a spike distribution at 0).
- **countResiduals**: Residuals from the count model.
- **zeroResiduals**: Residuals from the zero model.

**Value**

Vector of size M of the negative log-likelihoods for the various features.

**See Also**

`fitZig`

---

getPi

*Calculate the mixture proportions from the zero model / spike mass model residuals.*

**Description**

$F(x) = 1 / (1 + \exp(-(x-m)/s))$ (the CDF of the logistic distribution). Provides the probability that a real-valued random variable $X$ with a given probability distribution will be found at a value less than or equal to $x$. The output are the mixture proportions for the samples given the residuals from the zero model.

**Usage**

`getPi(residuals)`

---
getZ

Arguments

residuals Residuals from the zero model.

Value

Mixture proportions for each sample.

See Also

fitZig

getZ Calculate the current Z estimate responsibilities (posterior probabilities)

Description

Calculate the current Z estimate responsibilities (posterior probabilities)

Usage

getZ(z, zUsed, stillActive, nll, nllUSED)

Arguments

z Matrix (m x n) of estimate responsibilities (probabilities that a count comes from a spike distribution at 0).
zUsed Matrix (m x n) of estimate responsibilities (probabilities that a count comes from a spike distribution at 0) that are actually used (following convergence).
stillActive A vector of size M booleans saying if a feature is still active or not.
nll Vector of size M with the current negative log-likelihoods.
nllUSED Vector of size M with the converged negative log-likelihoods.

Value

A list of updated zUsed and nllUSED.

See Also

fitZig
isItStillActive  
*Function to determine if a feature is still active.*

**Description**

In the Expectation Maximization routine features posterior probabilities routinely converge based on a tolerance threshold. This function checks whether or not the feature’s negative log-likelihood (measure of the fit) has changed or not.

**Usage**

```r
isItStillActive(eps, tol, stillActive, stillActiveNLL, nll)
```

**Arguments**

- `eps`: Vector of size M (features) representing the relative difference between the new nll and old nll.
- `tol`: The threshold tolerance for the difference
- `stillActive`: A vector of size M booleans saying if a feature is still active or not.
- `stillActiveNLL`: A vector of size M recording the negative log-likelihoods of the various features, updated for those still active.
- `nll`: Vector of size M with the current negative log-likelihoods.

**Value**

None.

**See Also**

- `fitZig`

---

libSize  
*Access sample depth of coverage from MRexperiment object*

**Description**

Access the libSize vector represents the column (sample specific) sums of features, i.e. the total number of reads for a sample or depth of coverage. It is used by `fitZig`.

**Usage**

```r
libSize(object)
```
**Arguments**

- object: a MRexperiment object

**Value**

Library sizes

**Author(s)**

Joseph N. Paulson

**Examples**

```r
data(lungData)
head(libSize(lungData))
```

---

**Description**

Function to replace the scaling factors, aka the library sizes, of samples in a MRexperiment object.

**Usage**

```r
## S4 replacement method for signature 'MRexperiment,numeric'
libSize(object) <- value
```

**Arguments**

- object: a MRexperiment object
- value: vector of library sizes

**Value**

vector library sizes

**Author(s)**

Joseph N. Paulson

**Examples**

```r
data(lungData)
head(libSize(lungData) <- rnorm(1))
```
loadBiom

Load objects organized in the Biom format.

Description
Wrapper to load Biom formatted object.

Usage
loadBiom(file)

Arguments
file The biom object filepath.

Value
A MRexperiment object.

See Also
loadMeta loadPhenoData newMRexperiment biom2MRexperiment

Examples
#library(biomformat)
rich_dense_file = system.file("extdata", "rich_dense_otu_table.biom", package = "biomformat")
x = loadBiom(rich_dense_file)
x

loadMeta

Load a count dataset associated with a study.

Description
Load a matrix of OTUs in a tab delimited format

Usage
loadMeta(file, sep = "\t")

Arguments
file Path and filename of the actual data file.
sep File delimiter.
loadMetaQ

Value

A list with objects 'counts' and 'taxa'.

See Also

loadPhenoData

Examples

dataDirectory <- system.file("extdata", package="metagenomeSeq")
lung = loadMeta(file.path(dataDirectory,"CHK_NAME.otus.count.csv"))

loadMetaQ  Load a count dataset associated with a study set up in a Qiime format.

Description

Load a matrix of OTUs in Qiime's format

Usage

loadMetaQ(file)

Arguments

file  Path and filename of the actual data file.

Value

An list with 'counts' containing the count data, 'taxa' containing the otu annotation, and 'otus'.

See Also

loadMeta loadPhenoData

Examples

# see vignette
loadPhenoData  Load a clinical/phenotypic dataset associated with a study.

Description
Load a matrix of metadata associated with a study.

Usage
loadPhenoData(file, tran = TRUE, sep = "\t")

Arguments
- file: Path and filename of the actual clinical file.
- tran: Boolean. If the covariates are along the columns and samples along the rows, then tran should equal TRUE.
- sep: The separator for the file.

Value
The metadata as a dataframe.

See Also
loadMeta

Examples
dataDirectory <- system.file("extdata", package="metagenomeSeq")
clin = loadPhenoData(file.path(dataDirectory,"CHK_clinical.csv"),tran=TRUE)

lungData  OTU abundance matrix of samples from a smoker/non-smoker study

Description
This is a list with a matrix of OTU counts, OTU names, taxa annotations for each OTU, and phenotypic data. Samples along the columns and OTUs along the rows.

Format
A list of OTU matrix, taxa, otus, and phenotypes
makeLabels

Value

MRexperiment-class object of 16S lung samples.

References

makeLabels

Function to make labels simpler

Description

Beginning to transition to better axes for plots

Usage

makeLabels(x = "samples", y = "abundance", norm, log)

Arguments

x string for the x-axis
y string for the y-axis
norm is the data normalized?
log is the data logged?

Value

vector of x,y labels

Examples

metagenomeSeq::makeLabels(norm=TRUE, log=TRUE)
mergeMRexperiments  Merge two MRexperiment objects together

Description

This function will take two MRexperiment objects and merge them together finding common OTUs. If there are OTUs not found in one of the two MRexperiments then a message will announce this and values will be coerced to zero for the second table.

Usage

mergeMRexperiments(x, y)

Arguments

x  MRexperiment-class object 1.
y  MRexperiment-class object 2.

Value

Merged MRexperiment-class object.

Examples

data(mouseData)
newobj = mergeMRexperiments(mouseData,mouseData)
newobj

# let me know if people are interested in an option to merge by keys instead of row names.
data(lungData)
newobj = mergeMRexperiments(mouseData,lungData)
newobj

mergeTable  Merge two tables

Description

Merge two tables

Usage

mergeTable(x, y)
**Arguments**

- **x**
  - Table 1.
- **y**
  - Table 2.

**Value**

Merged table

---

**Deprecation**

*Deprecated functions in the metagenomeSeq package.*

**Description**

These functions may be removed completely in the next release.

**Usage**

```
deprecated_metagenomeSeq_function(x, value, ...)
```

**Arguments**

- **x**
  - For assignment operators, the object that will undergo a replacement (object inside parenthesis).
- **value**
  - For assignment operators, the value to replace with (the right side of the assignment).
- **...**
  - For functions other than assignment operators, parameters to be passed to the modern version of the function (see table).

---

**mouseData**

*OTU abundance matrix of mice samples from a diet longitudinal study*

**Description**

This is a list with a matrix of OTU counts, taxa annotations for each OTU, otu names, and vector of phenotypic data. Samples along the columns and OTUs along the rows.

**Format**

- A list of OTU matrix, taxa, otus, and phenotypes

**Value**

MRexperiment-class object of 16S mouse samples.
MRcoefs

Table of top-ranked features from fitZig or fitFeatureModel

Description

Extract a table of the top-ranked features from a linear model fit. This function will be updated soon to provide better flexibility similar to limma’s topTable.

Usage

MRcoefs(
  obj,  # Output of fitFeatureModel or fitZig.
  by = 2,  # Column number or column name specifying which coefficient or contrast of the linear model is of interest.
  coef = NULL,  # Column number(s) or column name(s) specifying which coefficient or contrast of the linear model to display.
  number = 10,  # The number of bacterial features to pick out.
  taxa = obj@taxa,  # Taxa list.
  uniqueNames = FALSE,  # Number the various taxa.
  adjustMethod = "fdr",  # Method to adjust p-values by. Default is "FDR". Options include "holm", "hochberg", "hommel", "bonferroni", "BH", "BY", "fdr", "none". See p.adjust for more details. Additionally, options using independent hypothesis weighting (IHW) are available. See MRihw for more details.
  alpha = 0.1,  # Value for p-value significance threshold when running IHW. The default is set to 0.1
  eff = 0,  # Group number.
  numberEff = FALSE,  # Count number of each taxa.
  counts = 0,  # Number of each taxa.
  file = NULL  # File name.
)

Arguments

obj Output of fitFeatureModel or fitZig.
by Column number or column name specifying which coefficient or contrast of the linear model is of interest.
coef Column number(s) or column name(s) specifying which coefficient or contrast of the linear model to display.
number The number of bacterial features to pick out.
taxa Taxa list.
uniqueNames Number the various taxa.
adjustMethod Method to adjust p-values by. Default is "FDR". Options include "holm", "hochberg", "hommel", "bonferroni", "BH", "BY", "fdr", "none". See p.adjust for more details. Additionally, options using independent hypothesis weighting (IHW) are available. See MRihw for more details.
alpha Value for p-value significance threshold when running IHW. The default is set to 0.1
MRcounts

group  One of five choices, 0,1,2,3,4. 0: the sort is ordered by a decreasing absolute value coefficient fit. 1: the sort is ordered by the raw coefficient fit in decreasing order. 2: the sort is ordered by the raw coefficient fit in increasing order. 3: the sort is ordered by the p-value of the coefficient fit in increasing order. 4: no sorting.

eff    Filter features to have at least a "eff" quantile or number of effective samples.

numberEff  Boolean, whether eff should represent quantile (default/FALSE) or number.

counts  Filter features to have at least 'counts' counts.

file  Name of output file, including location, to save the table.

Value
Table of the top-ranked features determined by the linear fit's coefficient.

See Also
fitZig fitFeatureModel MRtable MRfulltable

Examples

```r
data(lungData)
k = grep("Extraction.Control",pData(lungData)$SampleType)
lungTrim = lungData[,k]
lungTrim=filterData(lungTrim,present=30)
lungTrim=cumNorm(lungTrim,p=0.5)
smokingStatus = pData(lungTrim)$SmokingStatus
mod = model.matrix(~smokingStatus)
fit = fitZig(obj = lungTrim,mod=mod)
head(MRcoefs(fit))
####
fit = fitFeatureModel(obj = lungTrim,mod=mod)
head(MRcoefs(fit))
```

MRcounts  Accessor for the counts slot of a MRexperiment object

Description
The counts slot holds the raw count data representing (along the rows) the number of reads annotated for a particular feature and (along the columns) the sample.

Usage
```
MRcounts(obj, norm = FALSE, log = FALSE, sl = 1000)
```
Arguments

- **obj**: a `MRexperiment` object.
- **norm**: logical indicating whether or not to return normalized counts.
- **log**: TRUE/FALSE whether or not to log2 transform scale.
- **sl**: The value to scale by (default=1000).

Value

Normalized or raw counts

Author(s)

Joseph N. Paulson, jpaulson@umiacs.umd.edu

Examples

```r
data(lungData)
head(MRcounts(lungData))
```

---

**MRexperiment**

*Class "MRexperiment" – a modified eSet object for the data from high-throughput sequencing experiments*

Description

This is the main class for metagenomeSeq.

Objects from the Class

Objects should be created with calls to `newMRexperiment`.

Extends

Class `eSet` (package 'Biobase'), directly. Class `VersionedBiobase` (package 'Biobase'), by class "eSet", distance 2. Class `Versioned` (package 'Biobase'), by class "eSet", distance 3.

Methods

Class-specific methods.

- Subset operation, taking two arguments and indexing the sample and variable. Returns an `MRexperiment` object, including relevant metadata. Setting `drop=TRUE` generates an error. Subsetting the data, the experiment summary slot is repopulated and pData is repopulated after calling factor (removing levels not present).
MRexperiment2biom

Note

Note: This is a summary for reference. For an explanation of the actual usage, see the vignette.

MRexperiments are the main class in use by metagenomeSeq. The class extends eSet and provides additional slots which are populated during the analysis pipeline.

MRexperiment dataset are created with calls to newMRexperiment. MRexperiment datasets contain raw count matrices (integers) accessible through MRcounts. Similarly, normalized count matrices can be accessed (following normalization) through MRcounts by calling norm=TRUE. Following an analysis, a matrix of posterior probabilities for counts is accessible through posteriorProbs.

The normalization factors used in analysis can be recovered by normFactors, as can the library sizes of samples (depths of coverage), libSize.

Similarly to other RNASeq bioconductor packages available, the rows of the matrix correspond to a feature (be it OTU, species, gene, etc.) and each column an experimental sample. Pertinent clinical information and potential confounding factors are stored in the phenoData slot (accessed via pData).

To populate the various slots in an MRexperiment several functions are run. 1) cumNormStat calculates the proper percentile to calculate normalization factors. The cumNormStat slot is populated. 2) cumNorm calculates the actual normalization factors using p = cumNormStat.

Other functions will place subsequent matrices (normalized counts (cumNormMat), posterior probabilities (posteriorProbs))

As mentioned above, MRexperiment is derived from the virtual class, eSet and thereby has a phenoData slot which allows for sample annotation. In the phenoData data frame factors are stored. The normalization factors and library size information is stored in a slot called expSummary that is an annotated data frame and is repopulated for subsetted data.

Examples

# See vignette

**MRexperiment2biom**

*MRexperiment to biom objects*

**Description**

Wrapper to convert MRexperiment objects to biom objects.

**Usage**

MRexperiment2biom(
  obj,
  id = NULL,
  norm = FALSE,
  log = FALSE,
  sl = 1000,
  qiimeVersion = TRUE
)
Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>obj</td>
<td>The MRexperiment object.</td>
</tr>
<tr>
<td>id</td>
<td>Optional id for the biom matrix.</td>
</tr>
<tr>
<td>norm</td>
<td>normalize count table</td>
</tr>
<tr>
<td>log</td>
<td>log2 transform count table</td>
</tr>
<tr>
<td>sl</td>
<td>scaling factor for normalized counts.</td>
</tr>
<tr>
<td>qiimeVersion</td>
<td>Format fData according to QIIME specifications (assumes only taxonomy in fData).</td>
</tr>
</tbody>
</table>

Value

A biom object.

MRfulltable

Table of top microbial marker gene from linear model fit including sequence information

Description

Extract a table of the top-ranked features from a linear model fit. This function will be updated soon to provide better flexibility similar to limma's topTable. This function differs from link{MRcoefs} in that it provides other information about the presence or absence of features to help ensure significant features called are moderately present.

Usage

```r
MRfulltable(
  obj,
  by = 2,
  coef = NULL,
  number = 10,
  taxa = obj@taxa,
  uniqueNames = FALSE,
  adjustMethod = "fdr",
  group = 0,
  eff = 0,
  numberEff = FALSE,
  ncounts = 0,
  file = NULL
)
```
Arguments

- **obj**: Output of `fitFeatureModel` or `fitZig`.
- **by**: Column number or column name specifying which coefficient or contrast of the linear model is of interest.
- **coef**: Column number(s) or column name(s) specifying which coefficient or contrast of the linear model to display.
- **number**: The number of bacterial features to pick out.
- **taxa**: Taxa list.
- **uniqueNames**: Number the various taxa.
- **adjustMethod**: Method to adjust p-values by. Default is "FDR". Options include "holm", "hochberg", "hommel", "bonferroni", "BH", "BY", "fdr", "none". See `p.adjust` for more details.
- **group**: One of five choices: 0,1,2,3,4. 0: the sort is ordered by a decreasing absolute value coefficient fit. 1: the sort is ordered by the raw coefficient fit in decreasing order. 2: the sort is ordered by the raw coefficient fit in increasing order. 3: the sort is ordered by the p-value of the coefficient fit in increasing order. 4: no sorting.
- **eff**: Filter features to have at least a "eff" quantile or number of effective samples.
- **numberEff**: Boolean, whether eff should represent quantile (default/`FALSE`) or number.
- **ncounts**: Filter features to those with at least 'counts' counts.
- **file**: Name of output file, including location, to save the table.

Value

Table of the top-ranked features determined by the linear fit's coefficient.

See Also

- `fitZig`
- `fitFeatureModel`
- `MRcoefs`
- `MRtable`
- `fitPA`

Examples

```r
data(lungData)
k = grep("Extraction.Control", pData(lungData)$SampleType)
lungTrim = lungData[, -k]
lungTrim = filterData(lungTrim, present = 30)
lungTrim = cumNorm(lungTrim, p = 0.5)
smokingStatus = pData(lungTrim)$SmokingStatus
mod = model.matrix(~ smokingStatus)
fit = fitZig(obj = lungTrim, mod = mod)
head(MRfulltable(fit))
####
fit = fitFeatureModel(obj = lungTrim, mod = mod)
head(MRfulltable(fit))```
MRihw, fitFeatureModelResults-method

MRihw runs IHW within a MRcoefs() call

Description

Function used in MRcoefs() when "IHW" is set as the p value adjustment method

Usage

MRihw(obj, ...)

Arguments

obj Either a fitFeatureModelResults or fitZigResults object
...
other parameters

MRihw, fitFeatureModelResults-method

MRihw runs IHW within a MRcoefs() call

Description

Function used in MRcoefs() when "IHW" is set as the p value adjustment method

Usage

## S4 method for signature 'fitFeatureModelResults'
MRihw(obj, p, adjustMethod, alpha)

Arguments

obj Either a fitFeatureModelResults or fitZigResults object
p a vector of pvalues extracted from obj
adjustMethod Value specifying which adjustment method and which covariate to use for IHW pvalue adjustment. For obj of class fitFeatureModelResults-class, options are "ihw-abundance" (median feature count per row) and "ihw-ubiquity" (number of non-zero features per row). For obj of class fitZigResults-class, options are "ihw-abundance" (weighted mean per feature) and "ihw-ubiquity" (number of non-zero features per row).
alpha pvalue significance level specified for IHW call. Default is 0.1
Description

Function used in MRcoefs() when "IHW" is set as the p value adjustment method

Usage

```r
## S4 method for signature 'fitZigResults'
MRihw(obj, p, adjustMethod, alpha)
```

Arguments

- `obj` Either a fitFeatureModelResults or fitZigResults object
- `p` a vector of pvalues extracted from obj
- `adjustMethod` Value specifying which adjustment method and which covariate to use for IHW pvalue adjustment. For obj of class `fitFeatureModelResults-class`, options are "ihw-abundance" (median feature count per row) and "ihw-ubiquity" (number of non-zero features per row). For obj of class `fitZigResults-class`, options are "ihw-abundance" (weighted mean per feature) and "ihw-ubiquity" (number of non-zero features per row).
- `alpha` pvalue significance level specified for IHW call. Default is 0.1

Description

Extract a table of the top-ranked features from a linear model fit. This function will be updated soon to provide better flexibility similar to limma’s topTable. This function differs from `link{MRcoefs}` in that it provides other information about the presence or absence of features to help ensure significant features called are moderately present.

Usage

```r
MRtable(
  obj, 
  by = 2, 
  coef = NULL, 
  number = 10, 
  taxa = obj@taxa, 
)```
```r
uniqueNames = FALSE,
adjustMethod = "fdr",
group = 0,
eff = 0,
numberEff = FALSE,
counts = 0,
file = NULL
)

Arguments

obj Output of fitFeatureModel or fitZig.
by Column number or column name specifying which coefficient or contrast of the
linear model is of interest.
coef Column number(s) or column name(s) specifying which coefficient or contrast
of the linear model to display.
number The number of bacterial features to pick out.
taxa Taxa list.
uniqueNames Number the various taxa.
adjustMethod Method to adjust p-values by. Default is "FDR". Options include "holm",
"hochberg", "hommel", "bonferroni", "BH", "BY", "fdr", "none". See `p.adjust`
for more details.
group One of five choices, 0,1,2,3,4. 0: the sort is ordered by a decreasing absolute
value coefficient fit. 1: the sort is ordered by the raw coefficient fit in decreasing
order. 2: the sort is ordered by the raw coefficient fit in increasing order. 3:
the sort is ordered by the p-value of the coefficient fit in increasing order. 4: no
sorting.
eff Filter features to have at least a "eff" quantile or number of effective samples.
numberEff Boolean, whether eff should represent quantile (default/FALSE) or number.
counts Filter features to have at least 'counts' of counts.
file Name of file, including location, to save the table.

Value

Table of the top-ranked features determined by the linear fit's coefficient.

newMRexperiment

**Create a MRexperiment object**

**Description**

This function creates a MRexperiment object from a matrix or data frame of count data.

**Usage**

```r
newMRexperiment(
  counts,
  phenoData = NULL,
  featureData = NULL,
  libSize = NULL,
  normFactors = NULL
)
```

**Arguments**

- **counts** A matrix or data frame of count data. The count data is representative of the number of reads annotated for a feature (be it gene, OTU, species, etc). Rows should correspond to features and columns to samples.
- **phenoData** An AnnotatedDataFrame with pertinent sample information.
- **featureData** An AnnotatedDataFrame with pertinent feature information.
- **libSize** libSize, library size, is the total number of reads for a particular sample.
- **normFactors** normFactors, the normalization factors used in either the model or as scaling factors of sample counts for each particular sample.

**Details**

See MRexperiment-class and eSet (from the Biobase package) for the meaning of the various slots.

**Value**

an object of class MRexperiment
normFactors

Author(s)

Joseph N Paulson

Examples

cnts = matrix(abs(rnorm(1000)),nc=10)
obj <- newMRexperiment(cnts)

data(lungData)
head(normFactors(lungData))

Description

Function to access the scaling factors, aka the normalization factors, of samples in a MRexperiment object.

Usage

normFactors(object)

Arguments

object a MRexperiment object

Value

Normalization scaling factors

Author(s)

Joseph N. Paulson

Examples

data(lungData)
head(normFactors(lungData))
normFactors <-

Replace the normalization factors in a MReperiment object

Description

Function to replace the scaling factors, aka the normalization factors, of samples in a MReperiment object.

Usage

## S4 replacement method for signature 'MReperiment,numeric'
normFactors(object) <- value

Arguments

object a MReperiment object
value vector of normalization scaling factors

Value

Normalization scaling factors

Author(s)

Joseph N. Paulson

Examples

data(lungData)
head(normFactors(lungData) <- rnorm(1))

plotBubble

Basic plot of binned vectors.

Description

This function plots takes two vectors, calculates the contingency table and plots circles sized by the contingency table value. Optional significance vectors of the values significant will shade the circles by proportion of significance.
Usage

plotBubble(
  yvector,
  xvector,
  sigvector = NULL,
  nbreaks = 10,
  ybreak = quantile(yvector, p = seq(0, 1, length.out = nbreaks)),
  xbreak = quantile(xvector, p = seq(0, 1, length.out = nbreaks)),
  scale = 1,
  local = FALSE,
  ...
)

Arguments

yvector       A vector of values represented along y-axis.
xvector       A vector of values represented along x-axis.
sigvector     A vector of the names of significant features (names should match x/yvector).
nbreaks       Number of bins to break yvector and xvector into.
ybreak        The values to break the yvector at.
xbreak        The values to break the xvector at.
scale         Scaling of circle bin sizes.
local         Boolean to shade by significant bin numbers (TRUE) or overall proportion (FALSE).
...            Additional plot arguments.

Value

A matrix of features along rows, and the group membership along columns.

See Also

plotMRheatmap

Examples

data(mouseData)
mouseData = mouseData[which(rowSums(mouseData)>139),]
sparsity = rowMeans(MRcounts(mouseData)==0)
lor = log(fitPA(mouseData,cl=pData(mouseData)[,3]$oddsRatio)
plotBubble(lor,sparsity,main="lor ~ sparsity")
# Example 2
x = runif(100000)
y = runif(100000)
plotBubble(y,x)
**plotClassTimeSeries**  
*Plot abundances by class*

**Description**

Plot the abundance of values for each class using a spline approach on the estimated full model.

**Usage**

```r
plotClassTimeSeries(
  res,
  formula,
  xlab = "Time",
  ylab = "Abundance",
  color0 = "black",
  color1 = "red",
  include = c("1", "class", "time:class"),
  ...
)
```

**Arguments**

- `res`: Output of `fitTimeSeries` function
- `formula`: Formula for ssanova. Of the form: `abundance ~ ...` where `...` includes any pData slot value.
- `xlab`: X-label.
- `ylab`: Y-label.
- `color0`: Color of samples from first group.
- `color1`: Color of samples from second group.
- `include`: Parameters to include in prediction.
- `...`: Extra plotting arguments.

**Value**

Plot for abundances of each class using a spline approach on estimated null model.

**See Also**

`fitTimeSeries`

**Examples**

```r
data(mouseData)
res = fitTimeSeries(obj=mouseData, feature="Actinobacteria", class="status", id="mouseID", time="relativeTime", lvl='class', B=10)
plotClassTimeSeries(res, pch=21, bg=res$data$class, ylim=c(0,8))
```
plotCorr

Description

This function plots a heatmap of the "n" features with greatest variance across rows.

Usage

plotCorr(obj, n, norm = TRUE, log = TRUE, fun = cor, ...)

Arguments

obj
A MRexperiment object with count data.

n
The number of features to plot. This chooses the "n" features with greatest variance.

norm
Whether or not to normalize the counts - if MRexperiment object.

log
Whether or not to log2 transform the counts - if MRexperiment object.

fun
Function to calculate pair-wise relationships. Default is pearson correlation

...
Additional plot arguments.

Value

plotted correlation matrix

See Also

cumNormMat

Examples

data(mouseData)
plotCorr(obj=mouseData,n=200,cexRow = 0.4,cexCol = 0.4,trace="none",dendrogram="none",
        col = colorRampPalette(brewer.pal(9, "RdBu"))(50))
plotFeature

Basic plot function of the raw or normalized data.

Description

This function plots the abundance of a particular OTU by class. The function is the typical manhattan plot of the abundances.

Usage

plotFeature(
  obj,
  otuIndex,
  classIndex,
  col = "black",
  sort = TRUE,
  sortby = NULL,
  norm = TRUE,
  log = TRUE,
  sl = 1000,
  ...
)

Arguments

obj A MRexperiment object with count data.
otuIndex The row to plot
classIndex A list of the samples in their respective groups.
col A vector to color samples by.
sort Boolean, sort or not.
sortby Default is sort by library size, alternative vector for sorting
norm Whether or not to normalize the counts - if MRexperiment object.
log Whether or not to log2 transform the counts - if MRexperiment object.
sl Scaling factor - if MRexperiment object and norm=TRUE.
...

Value

counts and classindex

See Also

cumNorm
Examples

data(mouseData)
classIndex=list(Western=which(pData(mouseData)$diet=="Western"))
classIndex$BK=which(pData(mouseData)$diet=="BK")

par(mfrow=c(2,1))
dates = pData(mouseData)$date
plotFeature(mouseData,norm=FALSE,log=FALSE,otuIndex,classIndex,
col=dates,sortby=dates,ylab="Raw reads")

plotGenus

Basic plot function of the raw or normalized data.

Description

This function plots the abundance of a particular OTU by class. The function uses the estimated posterior probabilities to make technical zeros transparent.

Usage

plotGenus(
  obj,
  otuIndex,
  classIndex,
  norm = TRUE,
  log = TRUE,
  no = 1:length(otuIndex),
  labs = TRUE,
  xlab = NULL,
  ylab = NULL,
  jitter = TRUE,
  jitter.factor = 1,
  pch = 21,
  ...
)

Arguments

obj          An MRexperiment object with count data.
otuIndex     A list of the otus with the same annotation.
classIndex   A list of the samples in their respective groups.
norm         Whether or not to normalize the counts - if MRexperiment object.
log           Whether or not to log2 transform the counts - if MRexperiment object.
no            Which of the otuIndex to plot.
plotMRheatmap

Basic heatmap plot function for normalized counts.

Description

This function plots a heatmap of the 'n' features with greatest variance across rows (or other statistic).

Usage

plotMRheatmap(obj, n, norm = TRUE, log = TRUE, fun = sd, ...)

Arguments

obj          A MRexperiment object with count data.
n            The number of features to plot. This chooses the 'n' features of greatest positive statistic.
norm         Whether or not to normalize the counts - if MRexperiment object.
log          Whether or not to log2 transform the counts - if MRexperiment object.
fun          Function to select top 'n' features.
...          Additional plot arguments.

Value

plotted data

See Also

Examples

data(mouseData)
classIndex=list(controls=which(pData(mouseData)$diet=="BK"))
classIndex$cases=which(pData(mouseData)$diet=="Western")
otuIndex = grep("Strep",fData(mouseData)$family)
otuIndex=otuIndex[order(rowSums(MRcounts(mouseData)[otuIndex,]),decreasing=TRUE)]
plotGenus(mouseData,otuIndex,classIndex,no=1:2,xaxt="n",norm=FALSE,ylab="Strep normalized log(cpt)")
Value

plotted matrix

See Also

cumNormMat

Examples

data(mouseData)
trials = pData(mouseData)$diet
heatmapColColors=brewer.pal(12,"Set3")[as.integer(factor(trials))];
heatmapCols = colorRampPalette(brewer.pal(9, "RdBu"))(50)
### version using sd
plotMRheatmap(obj=mouseData,n=200,cexRow = 0.4,cexCol = 0.4,trace="none",
       col = heatmapCols,ColSideColors = heatmapColColors)
### version using MAD
plotMRheatmap(obj=mouseData,n=50,fun=mad,cexRow = 0.4,cexCol = 0.4,trace="none",
       col = heatmapCols,ColSideColors = heatmapColColors)

plotOrd

Plot of either PCA or MDS coordinates for the distances of normalized or unnormalized counts.

Description

This function plots the PCA / MDS coordinates for the "n" features of interest. Potentially uncovering batch effects or feature relationships.

Usage

plotOrd(
  obj,
  tran = TRUE,
  comp = 1:2,
  norm = TRUE,
  log = TRUE,
  usePCA = TRUE,
  useDist = FALSE,
  distfun = stats::dist,
  dist.method = "euclidian",
  n = NULL,
  ...
)
plotOTU

Arguments

obj A MRexperiment object or count matrix.
tran Transpose the matrix.
comp Which components to display
norm Whether or not to normalize the counts - if MRexperiment object.
log Whether or not to log2 the counts - if MRexperiment object.
usePCA TRUE/FALSE whether to use PCA or MDS coordinates (TRUE is PCA).
useDist TRUE/FALSE whether to calculate distances.
distfun Distance function, default is stats::dist
dist.method If useDist==TRUE, what method to calculate distances.
n Number of features to make use of in calculating your distances.
... Additional plot arguments.

Value

coordinates

See Also

cumNormMat

Examples

data(mouseData)
c1 = pData(mouseData)[,3]
plotOrd(mouseData,tran=TRUE,useDist=TRUE,pch=21,bg=factor(cl),usePCA=FALSE)

plotOTU

Basic plot function of the raw or normalized data.

Description

This function plots the abundance of a particular OTU by class. The function uses the estimated posterior probabilities to make technical zeros transparent.

Usage

plotOTU(
  obj,
  otu,
  classIndex,
  log = TRUE,
  norm = TRUE,
jitter.factor = 1,
pch = 21,
labs = TRUE,
xlab = NULL,
ylab = NULL,
jitter = TRUE,
...)

Arguments

obj A MRexperiment object with count data.

otu The row number/OTU to plot.

classIndex A list of the samples in their respective groups.

log Whether or not to log2 transform the counts - if MRexperiment object.

norm Whether or not to normalize the counts - if MRexperiment object.

jitter.factor Factor value for jitter.

pch Standard pch value for the plot command.

labs Whether to include group labels or not. (TRUE/FALSE)

xlab xlabel for the plot.

ylab ylabel for the plot.

jitter Boolean to jitter the count data or not.

... Additional plot arguments.

Value

Plotted values

See Also

cumNorm

Examples

data(mouseData)
classIndex=list(controls=which(pData(mouseData)$diet=="BK"))
classIndex$cases=which(pData(mouseData)$diet=="Western")
# you can specify whether or not to normalize, and to what level
plotOTU(mouseData,otu=9083,classIndex,norm=FALSE,main="9083 feature abundances")
plotRare

Plot of rarefaction effect

Description

This function plots the number of observed features vs. the depth of coverage.

Usage

plotRare(obj, cl = NULL, ...)

Arguments

obj A MRexperiment object with count data or matrix.
cl Vector of classes for various samples.
... Additional plot arguments.

Value

Library size and number of detected features

See Also

plotOrd, plotMRheatmap, plotCorr, plotOTU, plotGenus

Examples

data(mouseData)
c1 = factor(pData(mouseData)[,3])
res = plotRare(mouseData,c1=pch=21,bg=c1)
tmp=lapply(levels(cl), function(lv) lm(res[,]ident]-res[,]libSize]-1, subset=c1==lv))
for(i in 1:length(levels(cl))){
  abline(tmp[[i]], col=i)
}
legend("topleft", c("Diet 1","Diet 2"), text.col=c(1,2), box.col=NA)
plotTimeSeries  Plot difference function for particular bacteria

Description

Plot the difference in abundance for significant features.

Usage

plotTimeSeries(
  res,
  C = 0,
  xlab = "Time",
  ylab = "Difference in abundance",
  main = "SS difference function prediction",
  ...
)

Arguments

res  Output of fitTimeSeries function
C   Value for which difference function has to be larger or smaller than (default 0).
      xlab  X-label.
      ylab  Y-label.
      main  Main label.
      ...  Extra plotting arguments.

Value

Plot of difference in abundance for significant features.

See Also

fitTimeSeries

Examples

data(mouseData)
res = fitTimeSeries(obj=mouseData,feature="Actinobacteria",
  class="status",id="mouseID",time="relativeTime",lvl='class',B=10)
plotTimeSeries(res)
access the posterior probabilities that result from analysis.

Description

Accessing the posterior probabilities following a run through `fitZig`.

Usage

`posteriorProbs(obj)`

Arguments

- `obj`: a MRexperiment object.

Value

Matrix of posterior probabilities.

Author(s)

Joseph N. Paulson

Examples

```r
# This is a simple demonstration
data(lungData)
k = grep("Extraction.Control",pData(lungData)$SampleType)
lungTrim = lungData[-k]
k = which(rowSums(MRcounts(lungTrim)>0)<30)
lungTrim = cumNorm(lungTrim)
lungTrim = lungTrim[-k,]
smokingStatus = pData(lungTrim)$SmokingStatus
mod = model.matrix(~smokingStatus)
# The maxit is not meant to be 1 -- this is for demonstration/speed
settings = zigControl(maxit=1,verbose=FALSE)
fit = fitZig(obj = lungTrim,mod=mod,control=settings)
head(posteriorProbs(lungTrim))
```
returnAppropriateObj  

**Description**

Function to check if object is a MRexperiment class or matrix

**Usage**

```r
class(returnAppropriateObj(obj, norm, log, sl = 1000))
```

**Arguments**

- `obj`: a MRexperiment or matrix object
- `norm`: return a normalized MRexperiment matrix
- `log`: return a log transformed MRexperiment matrix
- `sl`: scaling value

**Value**

Matrix

**Examples**

```r
data(lungData)
head(returnAppropriateObj(lungData,norm=FALSE,log=FALSE))
```

ssFit  

**Description**

Sets up a data-frame with the feature abundance, class information, time points, sample ids and returns the fitted values for the fitted model.

**Usage**

```r
ssFit(
    formula,
    abundance,
    class,
    time,
    id,
    include = c("class", "time:class"),
    pd,
    ...
)
```
ssIntervalCandidate

Arguments

- formula: Formula for ssanova. Of the form: abundance ~ ... where ... includes any pData slot value.
- abundance: Numeric vector of abundances.
- class: Class membership (factor of group membership).
- time: Time point vector of relative times (same length as abundance).
- id: Sample / patient id.
- include: Parameters to include in prediction.
- pd: Extra variable.
- ...: Extra parameters for ssanova function (see ?ssanova).

Value

A list containing:

- data: Inputed data
  - fit: The interpolated / fitted values for timePoints
  - se: The standard error for CI intervals
  - timePoints: The time points interpolated over

See Also

cumNorm, fitTimeSeries, ssPermAnalysis, ssPerm, ssIntervalCandidate

Examples

# Not run

ssIntervalCandidate calculate interesting time intervals

Description

Calculates time intervals of interest using SS-Anova fitted confidence intervals.

Usage

ssIntervalCandidate(fit, standardError, timePoints, positive = TRUE, C = 0)
Arguments

- **fit**: SS-Anova fits.
- **standardError**: SS-Anova se estimates.
- **timePoints**: Time points interpolated over.
- **positive**: Positive region or negative region (difference in abundance is positive/negative).
- **C**: Value for which difference function has to be larger or smaller than (default 0).

Value

Matrix of time point intervals of interest

See Also

- `cumNorm`
- `fitTimeSeries`
- `ssFit`
- `ssPerm`
- `ssPermAnalysis`

Examples

```r
# Not run
```

---

**ssPerm**

*class permutations for smoothing-spline time series analysis*

Description

Creates a list of permuted class memberships for the time series permutation tests.

Usage

```r
ssPerm(df, B)
```

Arguments

- **df**: Data frame containing class membership and sample/patient id label.
- **B**: Number of permutations.

Value

A list of permuted class memberships

See Also

- `cumNorm`
- `fitTimeSeries`
- `ssFit`
- `ssPermAnalysis`
- `ssIntervalCandidate`

Examples

```r
# Not run
```
ssPermAnalysis

smoothing-splines anova fits for each permutation

Description

Calculates the fit for each permutation and estimates the area under the null (permutted) model for interesting time intervals of differential abundance.

Usage

ssPermAnalysis(
  data, 
  formula, 
  permList, 
  intTimes, 
  timePoints, 
  include = c("class", "time:class"), 
  ...
)

Arguments

data Data used in estimation.
formula Formula for ssanova. Of the form: abundance ~ ... where ... includes any pData slot value.
permList A list of permutted class memberships
intTimes Interesting time intervals.
timePoints Time points to interpolate over.
include Parameters to include in prediction.
... Options for ssanova

Value

A matrix of permuted area estimates for time intervals of interest.

See Also

cumNorm fitTimeSeries ssFit ssPerm ssIntervalCandidate

Examples

# Not run
trapz

**Trapezoidal Integration**

**Description**

Compute the area of a function with values 'y' at the points 'x'. Function comes from the pracma package.

**Usage**

\[
\text{trapz}(x, y)
\]

**Arguments**

- **x**: x-coordinates of points on the x-axis
- **y**: y-coordinates of function values

**Value**

Approximated integral of the function from 'min(x)' to 'max(x)'. Or a matrix of the same size as 'y'.

**Examples**

```r
# Calculate the area under the sine curve from 0 to pi:
N <- 101
x <- seq(0, pi, len = N)
y <- sin(x)
trapz(x, y)  #=> 1.999835504
```

```r
# Use a correction term at the boundary: -h^2/12*(f'(b)-f'(a))
N <- N - 1
h <- x[2] - x[1]
c_a <- (y[2] - y[1]) / h
c_b <- (y[N] - y[N-1]) / h
trapz(x, y) - h^2/12 * (c_b - c_a)  #=> 1.999999969
```

ts2MRexperiment

With a list of fitTimeSeries results, generate an MRexperiment that can be plotted with metavizr

**Description**

With a list of fitTimeSeries results, generate an MRexperiment that can be plotted with metavizr
Usage

```r
ts2MReperiment(
    obj,
    sampleNames = NULL,
    sampleDescription = "timepoints",
    taxonomyLevels = NULL,
    taxonomyHierarchyRoot = "bacteria",
    taxonomyDescription = "taxonomy",
    featuresOfInterest = NULL,
    featureDataOfInterest = NULL
)
```

Arguments

- **obj**: Output of `fitMultipleTimeSeries`
- **sampleNames**: Sample names for plot
- **sampleDescription**: Description of samples for plot axis label
- **taxonomyLevels**: Feature names for plot
- **taxonomyHierarchyRoot**: Root of feature hierarchy for `MReperiment`
- **taxonomyDescription**: Description of features for plot axis label
- **featuresOfInterest**: The features to select from the `fitMultipleTimeSeries` output
- **featureDataOfInterest**: featureData for the resulting `MReperiment`

Value

`MReperiment` that contains `fitTimeSeries` data, featureData, and phenoData

See Also

- `fitTimeSeries`
- `fitMultipleTimeSeries`

Examples

```r
data(mouseData)
res = fitMultipleTimeSeries(obj=mouseData,lvl='phylum',class="status",
    id="mouseID",time="relativeTime",B=1)
obj = ts2MReperiment(res)
obj
```
uniqueFeatures

Table of features unique to a group

Description

Creates a table of features, their index, number of positive samples in a group, and the number of reads in a group. Can threshold features by a minimum no. of reads or no. of samples.

Usage

uniqueFeatures(obj, cl, nsamples = 0, nreads = 0)

Arguments

obj Either a MRexperiment object or matrix.
cl A vector representing assigning samples to a group.
nsamples The minimum number of positive samples.
nreads The minimum number of raw reads.

Value

Table of features unique to a group

Examples

data(mouseData)
head(uniqueFeatures(mouseData[1:100,], cl=pData(mouseData)[,3]))

wrenchNorm

Computes normalization factors using wrench instead of cumNorm

Description

Calculates normalization factors using method published by M. Sentil Kumar et al. (2018) to compute normalization factors which considers compositional bias introduced by sequencers.

Usage

wrenchNorm(obj, condition)

Arguments

obj an MRexperiment object
condition case control label that wrench uses to calculate normalization factors
zigControl

Value

an MRexperiment object with updated normalization factors. Accessible by `normFactors`.

See Also

cumNorm fitZig

Examples

data(mouseData)
mouseData <- wrenchNorm(mouseData, condition = mouseData$diet)
head(normFactors(mouseData))

Description

Settings for the fitZig function

Usage

```r
zigControl(
  tol = 1e-04,
  maxit = 10,
  verbose = TRUE,
  dfMethod = "modified",
  pvalMethod = "default"
)
```

Arguments

tol The tolerance for the difference in negative log likelihood estimates for a feature to remain active.

maxit The maximum number of iterations for the expectation-maximization algorithm.

verbose Whether to display iterative step summary statistics or not.

dfMethod Either ‘default’ or ‘modified’ (by responsibilities).

pvalMethod Either ‘default’ or ‘bootstrap’.

Value

The value for the tolerance, maximum no. of iterations, and the verbose warning.

Note

`fitZig` makes use of `zigControl`.
