

Package ‘universalmotif’

June 17, 2019

Title Import, Modify, and Export Motifs with R

Version 1.2.1

URL <https://github.com/bjmt/universalmotif>

BugReports <https://github.com/bjmt/universalmotif/issues>

Description Allows for importing most common motif types into R for use by functions provided by other Bioconductor motif-related packages. Motifs can be exported into most major motif formats from various classes as defined by other Bioconductor packages. A suite of motif and sequence manipulation and analysis functions are included, including enrichment, comparison, P-value calculation, shuffling, trimming, higher-order motifs, and others.

Depends R (>= 3.5.0)

License GPL-3

Encoding UTF-8

Imports methods, stats, utils, ggplot2, ape, ggtree, ggseqlogo, gtools, Rcpp, Rdpack (>= 0.7), Biostrings, BiocGenerics, processx, S4Vectors, yaml

Suggests spelling, knitr, BiocStyle, TFBSTools, rmarkdown, MotifDb, testthat, Logolas, BiocParallel, seqLogo, motifStack

Enhances MotIV, PWMEnrich, rGADEM, motifRG

LinkingTo Rcpp

RdMacros Rdpack

VignetteBuilder knitr

biocViews MotifAnnotation, MotifDiscovery, DataImport, GeneRegulation

RoxygenNote 6.1.1

Roxygen list(markdown = TRUE)

add_multifreq	<i>Add multi-letter information to a motif.</i>
---------------	---

Description

If the original sequences are available for a particular motif, then they can be used to generate higher-order PPM matrices.

Usage

```
add_multifreq(motif, sequences, add.k = 2:3, RC = FALSE,
  threshold = 0.01, threshold.type = "pvalue", motifs.perseq = 1)
```

Arguments

motif	See convert_motifs() for acceptable formats. If the motif is not a universalmotif motif, then it will be converted.
sequences	XStringSet The alphabet must match that of the motif. If these sequences are all the same length as the motif, then they are all used to generate the multi-freq matrices. Otherwise scan_sequences() is first run to find the right sequence.
add.k	numeric(1) The k-let lengths to add.
RC	logical(1) Check the reverse complement of a DNA sequence. See scan_sequences() .
threshold	numeric(1) Between 0 and 1. See scan_sequences() .
threshold.type	character(1) One of c('logodds', 'pvalue'). See scan_sequences() .
motifs.perseq	numeric(1) If scan_sequences() is run, then this indicates how many hits from each sequence is to be used.

Details

At each position in the motif, then the probability of each k-let covering from the initial position to `ncol - 1` is calculated. Only positions within the motif are considered; this means that the final k-let probability matrix will have `ncol - 1` fewer columns. Calculating k-let probabilities for the missing columns would be trivial however, as you would only need the background frequencies. Since these would not be useful for `scan_sequences()` though, they are not calculated.

Currently `add_multifreq()` does not try to stay faithful to the default motif matrix when generating multifreq matrices. This means that if the sequences used for training are completely different from the actual motif, the multifreq matrices will be as well. However this is only really a problem if you supply `add_multifreq()` with a set of sequences of the same length as the motif; in this case `add_multifreq()` is forced to create the multifreq matrices from these sequences. Otherwise `add_multifreq()` will scan the input sequences for the motif and use the best matches to construct the multifreq matrices.

This 'multifreq' representation is only really useful within the **universalmotif** environment. Despite this, if you wish it can be preserved in text using `write_motifs()`.

Note: the number of rows for each k-let matrix is n^k , with n being the number of letters in the alphabet being used. This means that the size of the k-let matrix can become quite large as k increases. For example, if one were to wish to represent a DNA motif of length 10 as a 10-let, this would require a matrix with 1,048,576 rows (though at this point if what you want is to search for exact sequence matches, the motif format itself is not very useful).

Value

A **universalmotif** object with filled `multifreq` slot. The `bkg` slot is also expanded with corresponding higher order probabilities.

`scan_sequences()`, `convert_motifs()`, `write_motifs()`

Examples

```
sequences <- create_sequences(seqlen = 10)
motif <- create_motif()
motif.trained <- add_multifreq(motif, sequences, add.k = 2:4)
## peek at the 2-let matrix:
motif.trained["multifreq"]$`2`
```

ArabidopsisMotif

Arabidopsis motif in universalmotif format.

Description

Arabidopsis motif trained from `ArabidopsisPromoters` using MEME version 4. This motif was generated at the command line using the following command: `meme promoters.fa -revcomp -nmotifs 3 -mod anr -dna`.

Usage

ArabidopsisMotif

Format

[universalmotif](#)

ArabidopsisPromoters *Arabidopsis promoters as a DNASTringSet.*

Description

50 Arabidopsis promoters, each 1000 bases long. See the 'Advanced usage' vignette, section 7, for an example workflow describing extracting promoter sequences.

Usage

ArabidopsisPromoters

Format

[DNASTringSet](#)

compare_motifs *Compare motifs.*

Description

Compare motifs using four available metrics: Pearson correlation coefficient (Petrokovski 1996), Euclidean distance (Choi et al. 2004), Sandelin-Wasserman similarity (Sandelin and Wasserman 2004), and Kullback-Leibler divergence (Roepcke et al. 2005).

Usage

```
compare_motifs(motifs, compare.to, db.scores, use.freq = 1,
  use.type = "PPM", method = "MPCC", tryRC = TRUE, min.overlap = 6,
  min.mean.ic = 0.5, relative_entropy = FALSE,
  normalise.scores = FALSE, max.p = 0.01, max.e = 10,
  progress = TRUE, BP = FALSE)
```

Arguments

motifs	See convert_motifs() for acceptable motif formats.
compare.to	numeric If missing, compares all motifs to all other motifs. Otherwise compares all motifs to the specified motif(s).
db.scores	data.frame See details.
use.freq	numeric(1). For comparing the multifreq slot.

use.type	character(1) One of 'PPM' and 'ICM'. The latter allows for taking into account the background frequencies if <code>relative_entropy = TRUE</code> .
method	character(1) One of c('PCC', 'MPCC', 'EUCL', 'MEUCL', 'SW', 'MSW', 'KL', 'MKL'). See details.
tryRC	logical Try the reverse complement of the motifs as well, report the best score.
min.overlap	numeric(1) Minimum overlap required when aligning the motifs. Setting this to a number higher than the width of the motifs will not allow any overhangs. Can also be a number less than 1, representing the minimum fraction that the motifs must overlap.
min.mean.ic	numeric(1) Minimum mean information content between the two motifs for an alignment to be scored. This helps prevent scoring alignments between low information content regions of two motifs.
relative_entropy	logical(1) For ICM calculation. See <code>convert_type()</code> .
normalise.scores	logical(1) Favour alignments which leave fewer unaligned positions, as well as alignments between motifs of similar length. Similarity scores are multiplied by the ratio of aligned positions to the total number of positions in the larger motif, and the inverse for distance scores.
max.p	numeric(1) Maximum P-value allowed in reporting matches. Only used if <code>compare.to</code> is set.
max.e	numeric(1) Maximum E-value allowed in reporting matches. Only used if <code>compare.to</code> is set. The E-value is the P-value multiplied by the number of input motifs times two.
progress	logical(1) Show progress. Not recommended if <code>BP = TRUE</code> .
BP	logical(1) Allows the use of BiocParallel within <code>compare_motifs()</code> . See <code>BiocParallel::register()</code> to change the default backend. Setting <code>BP = TRUE</code> is only recommended for comparing large numbers of motifs (>10,000). Furthermore, the behaviour of <code>progress = TRUE</code> is changed if <code>BP = TRUE</code> ; the default BiocParallel progress bar will be shown (which unfortunately is much less informative).

Details

Comparisons are calculated between two motifs at a time. All possible alignments are scored, and the best score is reported. Scores are calculated per position and summed, unless the 'mean' version of the specific metric is chosen. If using a similarity metric, then the sum of scores will favour comparisons between longer motifs; and for distance metrics, the sum of scores will favour comparisons between short motifs. This can be avoided by using the 'mean' of scores.

- PCC: Pearson correlation coefficient
Per position:
$$\text{PCC} = \frac{\text{sum}(\text{col1} * \text{col2})}{\sqrt{\text{sum}(\text{col1}^2) * \text{sum}(\text{col2}^2)}}$$
- MPCC: Mean PCC
$$\text{MPCC} = \text{mean}(\text{PCC})$$
- EUCL: Euclidian distance
Per position:
$$\text{EUCL} = \frac{\sqrt{\text{sum}((\text{col1} - \text{col2})^2)}}{\sqrt{2}}$$

- MEUCL: Mean EUCL
MEUCL = sum(EUCL) / ncol(alignment)
- SW: Sandelin-Wasserman similarity
Per position:
SW = 2 - sum((col1 - col2)^2)
- MSW: Mean SW
MSW = mean(SW)
- KL: Kullback-Leibler divergence
Per position:
KL = 0.5 * sum(col1 * log(col1/col2) + col2 * log(col2/col1))
- MKL: Mean Kullback-Leibler divergence
MKL = mean(KL)

To note regarding p-values: p-values are pre-computed using the make_DBscores function. If not given, then uses a set of internal precomputed p-values from the JASPAR2018 CORE motifs. These precalculated scores are dependent on the length of the motifs being compared; this takes into account that comparing small motifs with larger motifs leads to higher scores, since the probability of finding a higher scoring alignment is higher.

The default p-values have been precalculated for regular DNA motifs; they are of little use for motifs with a different number of alphabet letters (or even the multifreq slot).

Value

matrix if compare.to is missing; data.frame otherwise.

- PCC: 0 represents complete distance, >0 similarity.
- MPCC: 0 represents complete distance, 1 complete similarity.
- EUCL: 0 represents complete similarity, >0 distance.
- MEUCL: 0 represents complete similarity, sqrt(2) complete distance.
- SW: 0 represents complete distance, >0 similarity.
- MSW: 0 represents complete distance, 2 complete similarity.
- KL: 0 represents complete similarity, >0 distance.
- MKL: 0 represents complete similarity, >0 complete distance.

Examples

```
motif1 <- create_motif()
motif2 <- create_motif()
motif1vs2 <- compare_motifs(list(motif1, motif2), method = "MPCC")
## to get a dist object:
as.dist(1 - motif1vs2)
```

convert_motifs	<i>Convert motif class.</i>
----------------	-----------------------------

Description

Allows for easy transfer of motif information between different classes defined by other Bioconductor packages. This function is also used by nearly all other functions in this package; so any motifs of a compatible class can be used without needed to convert beforehand.

Usage

```
convert_motifs(motifs, class = "universalmotif-universalmotif")

## S4 method for signature 'list'
convert_motifs(motifs,
  class = "universalmotif-universalmotif")

## S4 method for signature 'universalmotif'
convert_motifs(motifs,
  class = "universalmotif-universalmotif")

## S4 method for signature 'MotifList'
convert_motifs(motifs,
  class = "universalmotif-universalmotif")

## S4 method for signature 'TFFMFirst'
convert_motifs(motifs,
  class = "universalmotif-universalmotif")

## S4 method for signature 'PFMatrix'
convert_motifs(motifs,
  class = "universalmotif-universalmotif")
```

```

## S4 method for signature 'PWMMatrix'
convert_motifs(motifs,
  class = "universalmotif-universalmotif")

## S4 method for signature 'ICMatrix'
convert_motifs(motifs,
  class = "universalmotif-universalmotif")

## S4 method for signature 'XMatrixList'
convert_motifs(motifs,
  class = "universalmotif-universalmotif")

## S4 method for signature 'pwm'
convert_motifs(motifs,
  class = "universalmotif-universalmotif")

## S4 method for signature 'pcm'
convert_motifs(motifs,
  class = "universalmotif-universalmotif")

## S4 method for signature 'pfm'
convert_motifs(motifs,
  class = "universalmotif-universalmotif")

## S4 method for signature 'PWM'
convert_motifs(motifs,
  class = "universalmotif-universalmotif")

## S4 method for signature 'Motif'
convert_motifs(motifs,
  class = "universalmotif-universalmotif")

## S4 method for signature 'matrix'
convert_motifs(motifs,
  class = "universalmotif-universalmotif")

```

Arguments

motifs	Single motif object or list. See details.
class	character(1) Desired motif class. Input as 'package-class'. If left empty, defaults to 'universalmotif-universalmotif'. (See details.)

Details

The following package-class combinations can be used as input:

- MotifDb-MotifList
- TFBSTools-PFMatrix
- TFBSTools-PWMMatrix
- TFBSTools-ICMatrix
- TFBSTools-PFMatrixList

- TFBSTools-PWMMatrixList
- TFBSTools-ICMatrixList
- TFBSTools-TFFMFirst
- seqLogo-pwm
- motifStack-pcm
- motifStack-pfm
- PWMEnrich-PWM
- motifRG-Motif
- universalmotif-universalmotif
- matrix

The following package-class combinations can be output:

- MotIV-pwm2
- TFBSTools-PFMatrix
- TFBSTools-PWMMatrix
- TFBSTools-ICMatrix
- TFBSTools-TFFMFirst
- seqLogo-pwm
- motifStack-pcm
- motifStack-pfm
- PWMEnrich-PWM
- Biostrings-PWM (type = 'log2prob')
- rGADEM-motif
- universalmotif-universalmotif

Value

Single motif object or list.

Methods (by class)

- list: Convert a list of motifs.
- universalmotif: Convert a [universalmotif](#) object.
- MotifList: Convert MotifList motifs. (**MotifDb**)
- TFFMFirst: Convert TFFMFirst motifs. (**TFBSTools**)
- PFMatrix: Convert PFMatrix motifs. (**TFBSTools**)
- PWMMatrix: Convert PWMMatrix motifs. (**TFBSTools**)
- ICMatrix: Convert ICMatrix motifs. (**TFBSTools**)
- XMatrixList: Convert XMatrixList motifs. (**TFBSTools**)
- pwm: Convert pwm motifs. (**seqLogo**)
- pcm: Convert pcm motifs. (**motifStack**)
- pfm: Convert pfm motifs. (**motifStack**)
- PWM: Convert PWM motifs. (**PWMEnrich**)
- Motif: Convert Motif motifs. (**motifRG**)
- matrix: Create motif from matrices.

```
# convert from universalmotif:
jaspar <- read_jaspar(system.file("extdata", "jaspar.txt",
                                package = "universalmotif"))
if (requireNamespace("motifStack", quietly = TRUE)) {
  jaspar.motifstack.pfm <- convert_motifs(jaspar, "motifStack-pfm")
}

# convert from another class to universalmotif:
if (requireNamespace("TFBSTools", quietly = TRUE)) {
  library(TFBSTools)
  data(MA0003.2)
  motif <- convert_motifs(MA0003.2)

# convert from another class to another class
if (requireNamespace("PWMEnrich", quietly = TRUE)) {
  motif <- convert_motifs(MA0003.2, "PWMEnrich-PWM")
}

# the 'convert_motifs' function is embedded in the rest of the universalmotif
# functions; non-universalmotif class motifs can be used
MA0003.2.trimmed <- trim_motifs(MA0003.2)
# note: if the motif object going in has information that the
# 'universalmotif' class can't hold, it will be lost
}
```

convert_type	Convert <i>universalmotif</i> type.
--------------	-------------------------------------

Description

Switch between position count matrix (PCM), position probability matrix (PPM), position weight matrix (PWM), and information count matrix (ICM) types.

Usage

```
convert_type(motifs, type, pseudocount, nsize_correction = FALSE,
             relative_entropy = FALSE)
```

Arguments

motifs	See <code>convert_motifs()</code> for acceptable formats.
type	character(1) One of c('PCM', 'PPM', 'PWM', 'ICM').
pseudocount	numeric(1) Correction to be applied to prevent -Inf from appearing in PWM matrices. If missing, the pseudocount stored in the <code>universalmotif</code> 'pseudocount' slot will be used, which defaults to 0.8; the suggested value from Nishida et al. (2009).
nsize_correction	logical(1) If true, the ICM at each position will be corrected to account for small sample sizes. Only used if <code>relative_entropy = FALSE</code> .
relative_entropy	logical(1) If true, the ICM will be calculated as relative entropy. See details.

Details

Position count matrix (PCM), also known as position frequency matrix (PFM). For n sequences from which the motif was built, each position is represented by the numbers of each letter at that position. In theory all positions should have sums equal to n , but not all databases are this consistent. If converting from another type to PCM, column sums will be equal to the 'nsites' slot; if empty, 100 is used.

Position probability matrix (PPM), also known as position frequency matrix (PFM). At each position, the probability of individual letters is calculated by dividing the count for that letter by the total sum of counts at that position (`letter_count / position_total`). As a result, each position will sum to 1. Letters with counts of 0 will thus have a probability of 0, which can be undesirable when searching for motifs in a set of sequences. To avoid this a pseudocount can be added ($(\text{letter_count} + \text{pseudocount}) / (\text{position_total} + \text{pseudocount})$).

Position weight matrix (PWM; Stormo et al. (1982)), also known as position-specific weight matrix (PSWM), position-specific scoring matrix (PSSM), or log-odds matrix. At each position, each letter is represented by its log-likelihood ($\log_2(\text{letter_probability} / \text{background_probability})$), which is normalized using the background letter frequencies. A PWM matrix is constructed from a PPM; if any position has 0-probability letters to which pseudocounts were not added, then the final log-likelihood of these letters will be -Inf.

Information content matrix (ICM; Schneider and Stephens (1990)). An ICM is a PPM where each letter probability is multiplied by the total information content at that position. The information content of each position is determined as: $\text{totalIC} - H_i$, where the total information totalIC

totalIC <-log2(alphabet_length), and the Shannon entropy (Shannon 1948) for a specific position (Hi)

```
Hi <--sum(sapply(alphabet_frequencies,function(x) x * log(2))).
```

As a result, the total sum or height of each position is representative of its sequence conservation, measured in the unit 'bits', which is a unit of energy (Schneider (1991); see <https://fr-s-schneider.ncifcrf.gov/logorecommendations.html> for more information). However not all programs will calculate information content the same; some will 'correct' the total information content at each position using a correction factor as described by Schneider et al. (1986). This correction can be applied by setting `nsize_correction = TRUE`, however it will only be applied if the 'nsites' slot is not empty. This is done using `TFBSTools::schneider_correction` (Tan and Lenhard 2016). As such, converting from an ICM to which some form of correction has been applied will result in a PCM/PPM/PWM with slight inaccuracies.

Another method of calculating information content is calculating the relative entropy, also known as Kullback-Leibler divergence (Kullback and Leibler 1951). This accounts for background frequencies, which can be useful for genomes with a heavy imbalance in letter frequencies. For each position, the individual letter frequencies are calculated as `letter_freq * log2(letter_freq / bkg_freq)`. When calculating information content using Shannon entropy, the maximum content for each position will always be `log2(alphabet_length)`; this does not hold for information content calculated as relative entropy. Please note that conversion from ICM assumes the information content was *not* calculated as relative entropy.

Value

See `convert_motifs()` for possible output motif objects.

create_motif	<i>Create a motif.</i>
--------------	------------------------

Description

Create a motif from a set of sequences, a matrix, or generate a random motif.

Usage

```
create_motif(input, alphabet, type = "PPM", name = "motif",
             pseudocount = 0, bkg, nsites, alname, family, organism, bkg sites,
             strand, pval, qual, eval, extrainfo, add.multifreq)

## S4 method for signature 'missing'
create_motif(input, alphabet, type = "PPM",
             name = "motif", pseudocount = 0, bkg, nsites, alname, family,
             organism, bkg sites, strand, pval, qual, eval, extrainfo, add.multifreq)

## S4 method for signature 'numeric'
create_motif(input, alphabet, type = "PPM",
             name = "motif", pseudocount = 0, bkg, nsites, alname, family,
             organism, bkg sites, strand, pval, qual, eval, extrainfo, add.multifreq)

## S4 method for signature 'character'
create_motif(input, alphabet, type = "PPM",
             name = "motif", pseudocount = 0, bkg, nsites, alname, family,
             organism, bkg sites, strand, pval, qual, eval, extrainfo, add.multifreq)

## S4 method for signature 'matrix'
create_motif(input, alphabet, type = "PPM",
             name = "motif", pseudocount = 0, bkg, nsites, alname, family,
             organism, bkg sites, strand, pval, qual, eval, extrainfo, add.multifreq)

## S4 method for signature 'DNAStrngSet'
create_motif(input, alphabet, type = "PPM",
```

```

name = "motif", pseudocount = 0, bkg, nsites, altname, family,
organism, bkgsites, strand, pval, qval, eval, extrainfo, add.multifreq)

## S4 method for signature 'RNAStringSet'
create_motif(input, alphabet, type = "PPM",
name = "motif", pseudocount = 0, bkg, nsites, altname, family,
organism, bkgsites, strand, pval, qval, eval, extrainfo, add.multifreq)

## S4 method for signature 'AAStringSet'
create_motif(input, alphabet, type = "PPM",
name = "motif", pseudocount = 0, bkg, nsites, altname, family,
organism, bkgsites, strand, pval, qval, eval, extrainfo, add.multifreq)

## S4 method for signature 'BStringSet'
create_motif(input, alphabet, type = "PPM",
name = "motif", pseudocount = 0, bkg, nsites, altname, family,
organism, bkgsites, strand, pval, qval, eval, extrainfo, add.multifreq)

```

Arguments

input	character, numeric, matrix, XStringSet , or missing
alphabet	character(1) One of c('DNA', 'RNA', 'AA'), or a combined string representing the letters. If no alphabet is provided then it will try and guess the alphabet from the input.
type	character(1) One of c('PCM', 'PPM', 'PWM', 'ICM').
name	character(1) Motif name.
pseudocount	numeric(1) Correction to be applied to prevent -Inf from appearing in PWM matrices.
bkg	numeric A vector of probabilities, each between 0 and 1. If higher order backgrounds are provided, then the elements of the vector must be named. If unnamed, then the order of probabilities must be in the same order as the alphabetically sorted sequence alphabet.
nsites	numeric(1) Number of sites the motif was constructed from.
altname	character(1) Alternate motif name.
family	character(1) Transcription factor family.
organism	character(1) Species of origin.
bkgsites	numeric(1) Total number of sites used to find the motif.
strand	character(1) Whether the motif is specific to a certain strand.
pval	numeric(1) P-value associated with motif.
qval	numeric(1) Adjusted P-value associated with motif.
eval	numeric(1) E-value associated with motif.
extrainfo	character Any other extra information, represented as a named character vector.
add.multifreq	numeric If the motif is created from a set of sequences, then the add_multifreq() function can be run at the same time (with RC = FALSE).

Details

The aim of this function is provide an easy interface to creating [universalmotif](#) motifs, as an alternative to the default class constructor (i.e. `new('universalmotif', name=...)`). See examples for potential use cases.

Note: when generating random motifs, the `nsites` slot is also given a random value. Furthermore, be careful about the `nsites` slot when creating motifs from consensus strings: for example, the following call `create_motif("TAAAT")` generates a motif with `nsites = 1`.

See the examples section for more info on motif creation.

Value

[universalmotif](#) object.

Methods (by class)

- `missing`: Create a random motif of length 10.
- `numeric`: Create a random motif with a specified length.
- `character`: Create motif from a consensus string.
- `matrix`: Create motif from a matrix.
- `DNAStrngSet`: Create motif from a [DNAStrngSet](#).
- `RNAStringSet`: Create motif from a [RNAStringSet](#).
- `AAStringSet`: Create motif from a [AAStringSet](#).
- `BStringSet`: Create motif from a [BStringSet](#).

##### create motifs with filled 'multifreq' slot

DNA.motif.k2 <- create_motif(DNA.set, add.multifreq = 2)

##### create motifs from matrices

mat <- matrix(c(1, 1, 1, 1,
                2, 0, 2, 0,
                0, 2, 0, 2,
                0, 0, 0, 0),
              nrow = 4, byrow = TRUE)
DNA.motif <- create_motif(mat, alphabet = "DNA")
RNA.motif <- create_motif(mat, alphabet = "RNA", nsites = 20)

```

```

custom.motif <- create_motif(mat, alphabet = "QWER")

# specify custom alphabet
custom.motif <- create_motif(mat, alphabet = "QWER")

# alphabet can be detected from rownames
rownames(mat) <- DNA_BASES
DNA.motif <- create_motif(mat)
rownames(mat) <- c("Q", "W", "E", "R")
custom.motif <- create_motif(mat)

# matrices can also be used as input
mat.ppm <- matrix(c(0.1, 0.1, 0.1, 0.1,
                   0.5, 0.5, 0.5, 0.5,
                   0.1, 0.1, 0.1, 0.1,
                   0.3, 0.3, 0.3, 0.3),
                 nrow = 4, byrow = TRUE)

DNA.motif <- create_motif(mat.ppm, alphabet = "DNA", type = "PPM")

##### create random motifs

# these are generated as PPMs with 10 positions

DNA.motif <- create_motif()
RNA.motif <- create_motif(alphabet = "RNA")
AA.motif <- create_motif(alphabet = "AA")
custom.motif <- create_motif(alphabet = "QWER")

# the number of positions can be specified

DNA.motif <- create_motif(5)

# If the background frequencies are not provided, they are generated
# using `rpois`; positions are created using `rdirichlet(1, bkg)`.
# (calling `create_motif()` creates motifs with an average
# positional IC of 1)

DNA.motif <- create_motif(bkg = c(0.3, 0.2, 0.2, 0.3))
DNA.motif <- create_motif(10, bkg = c(0.1, 0.4, 0.4, 0.1))

```

create_sequences *Create random sequences.*

Description

Generate random sequences from any set of characters, represented as [XStringSet](#) objects.

Usage

```

create_sequences(alphabet = "DNA", seqnum = 100, seqlen = 100, freqs,
                monofreqs, difreqs, trifreqs, progress = FALSE, BP = FALSE)

```

Arguments

alphabet	character(1) One of c('DNA', 'RNA', 'AA'), or a string of characters to be used as the alphabet.
seqnum	numeric(1) Number of sequences to generate.
seqlen	numeric(1) Length of random sequences.
freqs	numeric A named vector of probabilities. The length of the vector must be the power of the number of letters in the sequence alphabet.
monofreqs	numeric Deprecated. Use freqs instead.
difreqs	numeric Deprecated. Use freqs instead.
trifreqs	numeric Deprecated. Use freqs instead.
progress	logical(1) Show progress. Not recommended if BP = TRUE.
BP	logical(1) Allows the use of BiocParallel within <code>create_sequences()</code> . See <code>BiocParallel::register()</code> to change the default backend. Setting BP = TRUE is only recommended for large jobs (such as <code>create_sequences(seqlen=100000, seqnum=100000)</code>). Furthermore, the behaviour of <code>progress = TRUE</code> is changed if BP = TRUE; the default BiocParallel progress bar will be shown (which unfortunately is much less informative).

Value

`XStringSet` The returned sequences are *unnamed*.

See Also

`create_motif()`, `shuffle_sequences()`

Examples

```
## create DNA sequences with slightly increased AT content:
sequences <- create_sequences(freqs = c(A=0.3, C=0.2, G=0.2, T=0.3))
## create custom sequences:
sequences.QWER <- create_sequences("QWER")
## you can include non-alphabet characters as well, even spaces:
sequences.custom <- create_sequences("!@#$ ")
```

enrich_motifs *Enrich for input motifs in a set of sequences.*

Description

Given a set of target and background sequences, test if the input motifs are significantly enriched in the targets sequences relative to the background sequences.

Usage

```
enrich_motifs(motifs, sequences, bkg.sequences, search.mode = "hits",
  max.p = 1e-05, max.q = 1e-05, max.e = 0.001, qval.method = "fdr",
  positional.test = "t.test", threshold = 0.001,
  threshold.type = "pvalue", verbose = 1, RC = FALSE, use.freq = 1,
  shuffle.k = 2, shuffle.method = "euler",
  shuffle.leftovers = "asis", return.scan.results = FALSE,
  progress = TRUE, BP = FALSE)
```

Arguments

motifs	See convert_motifs() for acceptable motif formats.
sequences	XStringSet Alphabet should match motif.
bkg.sequences	XStringSet Optional; if missing, shuffle_sequences() is used to create background sequences from the input sequences.
search.mode	character(1) One of c('hits', 'positional', 'both'). See details.
max.p	numeric(1) P-value threshold.
max.q	numeric(1) Adjusted P-value threshold. This is only useful if multiple motifs are being enriched for.
max.e	numeric(1). The E-value is calculated by multiplying the adjusted P-value with the number of input motifs times two (McLeay and Bailey 2010).
qval.method	character(1) See stats::p.adjust() .
positional.test	character(1) One of c('t.test', 'wilcox.test', 'chisq.test', 'shapiro.test'). If using the Shapiro test for normality, then only the input sequences are tested for positionality; the background sequences are ignored. See stats::t.test() , stats::wilcox.test() , stats::chisq.test() , stats::shapiro.test() .
threshold	numeric(1) Between 1 and 0. See scan_sequences() .
threshold.type	character(1) One of c('logodds', 'pvalue'). See scan_sequences() .
verbose	numeric(1) 0 for no output, 4 for max verbosity.
RC	logical(1) Whether to consider the reverse complement of the sequences. Only available for DNAStrngSet , RNAStrngSet sequences.
use.freq	numeric(1) If the multifreq slot of the motifs are filled, then they can be used to scan the sequences. See scan_sequences() .
shuffle.k	numeric(1) The k-let size to use when shuffling input sequences. Only used if no background sequences are input. See shuffle_sequences() .

shuffle.method	character(1) One of c('euler', 'markov', 'linear', 'random'). See shuffle_sequences() . The 'random' method is deprecated and will be removed in the next minor version.
shuffle.leftovers	character(1) One of c('asis', 'first', 'split', 'discard'). Only used if shuffle.method = 'random'. See shuffle_sequences() .
return.scan.results	logical(1) Return output from scan_sequences() . For large jobs, leaving this as FALSE can save a small amount time by preventing construction of the complete results data.frame from scan_sequences() .
progress	logical(1) Show progress. Note recommended if BP = TRUE. Set to FALSE if verbose = 0
BP	logical(1) Allows the use of BiocParallel within enrich_motifs() . See BiocParallel::register() to change the default backend. Setting BP = TRUE is only recommended for exceptionally large jobs (be wary of memory usage however, as enrich_motifs() does not try and limit itself in this regard). Furthermore, the behaviour of progress = TRUE is changed if BP = TRUE; the default BiocParallel progress bar will be shown (which unfortunately is much less informative).

Details

To find enriched motifs, [scan_sequences\(\)](#) is run on both target and background sequences. If search.mode = 'hits', [stats::fisher.test\(\)](#) is run to test for enrichment. If search.mode = 'positional', then the test as set by positional.test is run to check for positional differences between target and background sequences. However if positional.test = 'shapiro.test', then only target sequence hits are considered.

Value

data.frame Motif enrichment results. The resulting data.frame contains the following columns:

- * motif Motif name.
- * total.seq.hits Total number of matches across all target sequences.
- * num.seq.hits Number of target sequences which contain matches.
- * num.seq.total Number of target sequences.
- * total.bkg.hits Total number of matches across all background sequences.
- * num.bkg.hits Number of background sequences which contain matches.
- * num.bkg.total Number of background sequences.
- * Pval.hits P-value of enrichment. Only shown if search.mode = c('hits', 'both').
- * Qval.hits Q-val of enrichment. Only shown if search.mode = c('hits', 'both').
- * Eval.hits E-val of enrichment. Only shown if search.mode = c('hits', 'both').
- * Pval.pos P-value of positional comparison. Only shown if search.mode = c('positional', 'both').
- * Qval.pos Q-value of positional comparison. Only shown if search.mode = c('positional', 'both').
- * Eval.pos E-value of positional comparison. Only shown if search.mode = c('positional', 'both').

enrich_motifs(ArabidopsisMotif, ArabidopsisPromoters, threshold = 0.01)
```

examplomotif

Example motif in universalmotif format.

Description

A simple DNA motif. To recreate this motif: `create_motif("TATAAW", nsites = numeric())`

Usage

```
examplomotif
```

Format

[universalmotif](#)

examplomotif2

Another example motif in universalmotif format.

Description

A simple DNA motif with a non-empty multifreq slot. See the 'Advanced usage' vignette, section 2, for manually recreating this motif.

Usage

```
examplomotif2
```

Format

[universalmotif](#)

filter_motifs	<i>Filter a list of motifs.</i>
---------------	---------------------------------

Description

Filter motifs based on the contents of available [universalmotif](#) slots. If the input motifs are not of [universalmotif](#), then they they will be converted for the duration of the `filter_motifs()` operation.

Usage

```
filter_motifs(motifs, name, altname, family, organism, width, alphabet,
              type, icscore, nsites, strand, pval, qval, eval)
```

Arguments

motifs	list See convert_motifs() for acceptable formats.
name	character Keep motifs by names.
altname	character Keep motifs by altnames.
family	character Keep motifs by family.
organism	character Keep motifs by organism.
width	numeric(1) Keep motifs with minimum width.
alphabet	character Keep motifs by alphabet.
type	character Keep motifs by type.
icscore	numeric(1) Keep motifs with minimum total IC.
nsites	numeric(1) Keep motifs with minimum number of target sites.
strand	character Keeps motifs by strand.
pval	numeric(1) Keep motifs by max P-value.
qval	numeric(1) Keep motifs by max Q-value.
eval	numeric(1) Keep motifs by max E-val.

Value

list Motifs. An attempt will be made to preserve the original class, see [convert_motifs\(\)](#) for limitations.

Author(s)

Benjamin Jean-Marie Tremblay, <b2tremblay@uwaterloo.ca>

Examples

```
## By minimum IC:
jaspar <- read_jaspar(system.file("extdata", "jaspar.txt",
                                package = "universalmotif"))
jaspar.ic10 <- filter_motifs(jaspar, icscore = 10)

## By organism:
if (requireNamespace("MotifDb", quietly = TRUE) && .Platform$OS.type == "unix") {
```

```

library(MotifDb)
motifs <- convert_motifs(MotifDb)
motifs <- filter_motifs(motifs, organism = c("Athaliana", "Mmusculus"))
}

```

get_bkg

Calculate sequence background.

Description

For a set of input sequences, calculate the overall sequence background for any k-let size. Only recommended for non-DNA/RNA sequences: otherwise use the much faster and more efficient `Biostrings::oligonucleotideFrequency()`.

Usage

```

get_bkg(sequences, k = 1:3, as.prob = TRUE, pseudocount = 0,
        alphabet = NULL, to.meme = NULL, RC = FALSE, list.out = TRUE,
        progress = FALSE, BP = FALSE)

```

Arguments

sequences	<code>XStringSet</code> Input sequences. Note that if multiple sequences are present, they will be combined into one.
k	integer Size of k-let. Background can be calculated for any k-let size.
as.prob	logical(1) Whether to return k-let counts or probabilities.
pseudocount	integer(1) Add a count to each possible k-let. Prevents any k-let from having 0 or 1 probabilities.
alphabet	character(1) Provide a custom alphabet to calculate a background for. If NULL, then standard letters will be assumed for DNA, RNA and AA sequences, and all unique letters found will be used for <code>BStringSet</code> type sequences.
to.meme	If not NULL, then <code>get_bkg()</code> will return the sequence background in MEME Markov Background Model format. Input for this argument will be used for <code>cat(..., file = to.meme)</code> within <code>get_bkg()</code> . See http://meme-suite.org/doc/bfile-format.html for a description of the format.
RC	logical(1) Calculate the background of the reverse complement of the input sequences as well. Only valid for DNA/RNA.
list.out	logical(1) Return background frequencies as list, with an entry for each k. If FALSE, return a single vector.
progress	logical(1) Show progress. Not recommended if BP = TRUE.
BP	logical(1) Allows the use of BiocParallel within <code>get_bkg()</code> . See <code>BiocParallel::register()</code> to change the default backend. Setting BP = TRUE is only recommended for large jobs. Furthermore, the behaviour of progress = TRUE is changed if BP = TRUE; the default BiocParallel progress bar will be shown (which unfortunately is much less informative).

Value

If `to.meme = NULL` and `list.out = TRUE`: a list with each entry being a named numeric vector for every element in `k`. If `to.meme = NULL` and `list.out = FALSE`: a named numeric vector. Otherwise: `NULL`, invisibly.

bkg.DNA2 <- oligonucleotideFrequency(seqs.DNA, 3, 1, as.prob = FALSE)
bkg.DNA2 <- colSums(bkg.DNA2)
all(bkg.DNA == bkg.DNA2)

## Create a MEME background file
get_bkg(seqs.DNA, k = 1:3, to.meme = stdout(), pseudocount = 1)

## Non-DNA/RNA/AA alphabets
seqs.QWERTY <- create_sequences("QWERTY")
bkg.QWERTY <- get_bkg(seqs.QWERTY, k = 1:2)
```

JASPAR2018_CORE_DBSCORES

JASPAR2018 CORE database scores.

Description

For use with [compare_motifs\(\)](#). The precomputed scores allow for fast P-value estimation. These scores were generated using [make_DBscores\(\)](#) with the JASPAR2018 CORE motif set, with `normalise.scores = FALSE`. This particular set of scores is organized as a list, with each list item being a `data.frame` of scores for a specific comparison method. In each `data.frame` is the mean and `sd` of scores resulting between the comparisons of JASPAR2018 CORE motifs with randomized motifs of the specified subject and target motif length.

Usage

```
JASPAR2018_CORE_DBSCORES
```

Format

list with three data.frames

JASPAR2018_CORE_DBSCORES_NORM

JASPAR2018 CORE database scores (normalised).

Description

For use with `compare_motifs()`. The precomputed scores allow for fast P-value estimation. These scores were generated using `make_DBScores()` with the JASPAR2018 CORE motif set, with `normalise.scores = TRUE`. This particular set of scores is organized as a list, with each list item being a data.frame of scores for a specific comparison method. In each data.frame is the mean and sd of scores resulting between the comparisons of JASPAR2018 CORE motifs with randomized motifs of the specified subject and target motif length.

Usage

JASPAR2018_CORE_DBSCORES_NORM

Format

list with three data.frames

merge_motifs

Merge motifs.

Description

Aligns the motifs using `compare_motifs()`, then averages the motif PPMs. Currently the `multifreq` slot, if filled in any of the motifs, will be dropped. Only 0-order background probabilities will be kept.

Usage

```
merge_motifs(motifs, method = "MPCC", use.type = "PPM",
             min.overlap = 6, min.mean.ic = 0.5, tryRC = TRUE,
             relative_entropy = FALSE, normalise.scores = FALSE)
```

Arguments

motifs	See <code>convert_motifs()</code> for acceptable motif formats.
method	character(1) One of c('PCC', 'MPCC', 'EUCL', 'MEUCL', 'SW', 'MSW', 'KL', 'MKL'). See details.
use.type	character(1) One of 'PPM' and 'ICM'. The latter allows for taking into account the background frequencies if <code>relative_entropy = TRUE</code> .

min.overlap	numeric(1) Minimum overlap required when aligning the motifs. Setting this to a number higher than the width of the motifs will not allow any overhangs. Can also be a number less than 1, representing the minimum fraction that the motifs must overlap.
min.mean.ic	numeric(1) Minimum mean information content between the two motifs for an alignment to be scored. This helps prevent scoring alignments between low information content regions of two motifs.
tryRC	logical Try the reverse complement of the motifs as well, report the best score.
relative_entropy	logical(1) For ICM calculation. See convert_type() .
normalise.scores	logical(1) Favour alignments which leave fewer unaligned positions, as well as alignments between motifs of similar length. Similarity scores are multiplied by the ratio of aligned positions to the total number of positions in the larger motif, and the inverse for distance scores.

Value

A single motif object. See [convert_motifs\(\)](#) for available formats.

Author(s)

Benjamin Jean-Marie Tremblay, <b2tremblay@uwaterloo.ca>

See Also

[compare_motifs\(\)](#)

Examples

```
if (requireNamespace("MotifDb", quietly = TRUE) && .Platform$OS.type == "unix") {
  library(MotifDb)
  merged.motif <- merge_motifs(MotifDb[1:5])
}
```

motif_peaks

Look for overrepresented motif position peaks in a set of sequences.

Description

Using the motif position data from [scan_sequences\(\)](#) (or elsewhere), test whether certain positions in the sequences have significantly higher motif density.

Usage

```
motif_peaks(hits, seq.length, seq.count, bandwidth, max.p = 10^-6,
  peak.width = 3, nrand = 1000, plot = TRUE, BP = FALSE)
```

Arguments

hits	numeric	A vector of sequence positions indicating motif sites.
seq.length	numeric(1)	Length of sequences. Only one number is allowed, as all sequences must be of identical length. If missing, then the largest number from hits is used.
seq.count	numeric(1)	Number of sequences with motif sites. If missing, then the number of unique values in hits is used.
bandwidth	numeric(1)	Peak smoothing parameter. Smaller numbers will result in skinnier peaks, larger numbers will result in wider peaks. Leaving this empty will cause motif_peaks() to generate one by itself (see 'details').
max.p	numeric(1)	Maximum P-value allowed for finding significant motif site peaks.
peak.width	numeric(1)	Minimum peak width. A peak is defined as the highest point within the value set by peak.width.
nrand	numeric(1)	Number of random permutations for generating a null distribution. In order to calculate P-values, a set of random motif site positions are generated nrand times.
plot	logical(1)	Will create a ggplot2 object displaying motif peaks.
BP	logical(1)	Allows for the use of BiocParallel within motif_peaks() . See BiocParallel::register() to change the default backend. Setting BP = TRUE is only recommended for exceptionally large jobs. Keep in mind that this function will not attempt to limit its memory usage.

Details

Kernel smoothing is used to calculate motif position density. The implementation for this process is based on code from the **KernSmooth** R package. These density estimates are used to determine peak locations and heights. To calculate the P-values of these peaks, a null distribution is calculated from peak heights of randomly generated motif positions.

If the bandwidth option is not supplied, then the following code is used (from **KernSmooth**):

```
del0 <- (1 / (4 * pi))^(1 / 10)
bandwidth <- del0 * (243 / (35 * length(hits)))^(1 / 5) * sqrt(var(hits))
```

Value

A data.frame with peak positions and P-values. If plot = TRUE, then a list is returned with the data.frame as the first item and the ggplot2 object as the second item.

```

motif_pvalue

Motif P-value and scoring utility

Description

For calculating p-values/logodds scores for any number of motifs.

Usage

```

motif_pvalue(motifs, score, pvalue, bkg.probs, use.freq = 1, k = 6,
             progress = ifelse(length(motifs) > 1, TRUE, FALSE), BP = FALSE)

```

Arguments

motifs	See convert_motifs() for acceptable motif formats.
score	numeric Get a p-value for a motif from a logodds score.
pvalue	numeric Get a logodds score for a motif from a p-value.
bkg.probs	numeric, list If supplying individual background probabilities for each motif, a list. If missing, retrieves the background from the motif bkg slot. Note that this only influences calculating p-values from an input score; calculating a score from an input p-value currently assumes a uniform background.
use.freq	numeric(1) By default uses the regular motif matrix; otherwise uses the corresponding multifreq matrix. Max is 3.
k	numeric(1) For speed, scores/p-values can be approximated after subsetting the motif every k columns. If k is a value equal or higher to the size of input motif(s), then the calculations are (nearly) exact. The default, 6, is recommended to those looking for a good tradeoff between speed and accuracy for jobs requiring repeated calculations.
progress	logical(1) Show progress. Not recommended if BP = TRUE.
BP	logical(1) Allows the use of BiocParallel within motif_pvalue() . See BiocParallel::register to change the default backend. Setting BP = TRUE is only recommended for exceptionally large jobs. Furthermore, the behaviour of progress = TRUE is changed if BP = TRUE; the default BiocParallel progress bar will be shown (which unfortunately is much less informative).

Details

Calculating p-values for motifs can be very computationally intensive. This is due to how p-values must be calculated: for a given score, all possible sequences which score equal or higher must be found, and the probability for each of these sequences (based on background probabilities) summed. For a DNA motif of length 10, the number of possible unique sequences is $4^{10} = 1,048,576$. Finding all possible sequences higher than a given score can be done very efficiently and quickly with a branch-and-bound algorithm, but as the motif length increases this calculation becomes impractical. To get around this, the p-value calculation can be approximated.

In order to calculate p-values for longer motifs, this function uses the approximation proposed by Hartmann et al. (2013), where the motif is subset, p-values calculated for the subsets, and finally combined for a total p-value. The smaller the size of the subsets, the faster the calculation; but also, the bigger the approximation. This can be controlled by setting `k`. In fact, for smaller motifs (< 13 positions) calculating exact p-values can be done individually in reasonable time by setting `k = 12`.

To calculate a score based on a given p-value, the means and variances of each motif subsets are combined to estimate the distribution of all possible scores using `stats::qnorm()`:

```
qnorm(pvalue, mean = sum(subset.means), sd = sqrt(sum(subset.vars)))
```

For calculating exact scores, `stats::ecdf()` and `stats::quantile()` are used:

```
quantile(ecdf(scores), probs = pvalue)
```

It is important to keep in mind that both approximate and exact score calculations assume uniform backgrounds, so do not use this function for motifs with extremely imbalanced backgrounds. To get all possible scores for each subset, `expand.grid()` is used instead of the branch-and-bound algorithm used for calculating p-values. Keep this in mind for determining the best `k` value for motifs with alphabets longer than those of DNA/RNA motifs.

Value

numeric A vector of scores/p-values.

`motif_score()`

Examples

```
data(examplemotif)

## p-value/score calculations are performed using the PWM version of the
## motif; these calculations do not work if any -Inf values are present
examplemotif[,"pseudocount"] <- 1
# or
examplemotif <- normalize(examplemotif)

## get a minimum score based on a p-value
```

```

motif_pvalue(examplemotif, pvalue = 0.001)

## get the probability of a particular sequence hit
motif_pvalue(examplemotif, score = 0)

## the calculations can be performed for multiple motifs
motif_pvalue(list(examplemotif, examplemotif), pvalue = c(0.001, 0.0001))

## Compare score thresholds and P-value:
scores <- motif_score(examplemotif, c(0.6, 0.7, 0.8, 0.9))
motif_pvalue(examplemotif, scores)

## Calculate the probability of getting a certain match or better:
TATATAT <- score_match(examplemotif, "TATATAT")
TATATAG <- score_match(examplemotif, "TATATAG")
motif_pvalue(examplemotif, TATATAT)
motif_pvalue(examplemotif, TATATAG)

## Get all possible matches by P-value:
get_matches(examplemotif, motif_pvalue(examplemotif, pvalue = 0.0001))

```

motif_rc

Get the reverse complement of a DNA or RNA motif.

Description

For any motif, change the motif slot to it's reverse complement. If the multifreq slot is filled, then it is also applied. No other slots are affected.

Usage

```
motif_rc(motifs, ignore.alphabet = FALSE)
```

Arguments

motifs See [convert_motifs\(\)](#) for acceptable formats

ignore.alphabet logical(1) If TRUE, then [motif_rc\(\)](#) throws an error when it detects a non-DNA/RNA motif. If FALSE, it will proceed regardless.

Value

See [convert_motifs\(\)](#) for available output formats.

Author(s)

Benjamin Jean-Marie Tremblay, <b2tremblay@uwaterloo.ca>

Examples

```

jaspar <- read_jaspar(system.file("extdata", "jaspar.txt",
                                package = "universalmotif"))
jaspar.rc <- motif_rc(jaspar)

```

motif_tree

Generate **ggplot2** motif trees with **ggtree**.

Description

For more powerful motif tree functions, see the **motifStack** package. The `motif_tree()` function compares motifs with `compare_motifs()` to create a distance matrix, which is used to generate a phylogeny via **ape**. This can be plotted with `ggtree::ggtree()`. The purpose of this function is simply to combine the `compare_motifs()` and `ggtree::ggtree()` steps into one. For more control over tree creation, it is recommend to do these steps separately. See the Advanced Usage vignette for such a workthrough.

Usage

```
motif_tree(motifs, layout = "circular", linecol = "family",
  labels = "none", tipsize = "none", legend = TRUE,
  branch.length = "none", db.scores, method = "MPCC",
  use.type = "PPM", min.overlap = 6, tryRC = TRUE,
  min.mean.ic = 0.5, relative_entropy = FALSE, progress = TRUE,
  BP = FALSE, ...)
```

Arguments

motifs	list, dist See <code>convert_motifs()</code> for available formats. Alternatively, the resulting comparison matrix from <code>compare_motifs()</code> (run as <code>dist(results)</code>) beforehand; if the comparison was performed with a similarity metric, make sure to convert to distances first).
layout	character(1) One of <code>c('rectangular', 'slanted', 'fan', 'circular', 'radial', 'equal_ang</code> See <code>ggtree::ggtree()</code> .
linecol	character(1) <code>universalmotif</code> slot to use to colour lines (e.g. 'family'). Not available for dist input (see examples for how to add it manually). See <code>ggtree::ggtree()</code> .
labels	character(1) <code>universalmotif</code> slot to use to label tips (e.g. 'name'). For dist input, only 'name' is available. See <code>ggtree::ggtree()</code> .
tipsize	character(1) <code>universalmotif</code> slot to use to control tip size (e.g. 'icscore'). Not available for dist input (see examples for how to add it manually). See <code>ggtree::ggtree()</code> .
legend	logical(1) Show legend for line colour and tip size. See <code>ggtree::ggtree()</code> .
branch.length	character(1) If 'none', draw a cladogram. See <code>ggtree::ggtree()</code> .
db.scores	data.frame See <code>compare_motifs()</code> .
method	character(1) One of <code>c('PCC', 'MPCC', 'EUCL', 'SW', 'MSW', 'KL', 'MKL')</code> . See <code>compare_motifs()</code> .
use.type	character(1) <code>c('PPM', 'ICM')</code> . The latter allows for taking into account the background frequencies (only if <code>relative_entropy = TRUE</code>). See <code>compare_motifs()</code> .
min.overlap	numeric(1) Minimum overlap required when aligning the motifs. Setting this to a number higher then the width of the motifs will not allow any overhangs. Can also be a number less than 1, representing the minimum fraction that the motifs must overlap. See <code>compare_motifs()</code> .

tryRC	logical(1) Try the reverse complement of the motifs as well, report the best score. See <code>compare_motifs()</code> .
min.mean.ic	numeric(1) Minimum information content between the two motifs for an alignment to be scored. This helps prevent scoring alignments between low information content regions of two motifs. See <code>compare_motifs()</code> .
relative_entropy	logical(1) For ICM calculation. See <code>convert_type()</code> .
progress	logical(1) Show progress of <code>compare_motifs()</code> . Not recommended if BP = TRUE.
BP	logical(1) Allows the use of BiocParallel within <code>compare_motifs()</code> . See <code>BiocParallel::register()</code> to change the default backend. Setting BP = TRUE is only recommended for comparing large numbers of motifs (>10,000). Furthermore, the behaviour of progress = TRUE is changed if BP = TRUE; the default BiocParallel progress bar will be shown (which unfortunately is much less informative).
...	ggtree params. See <code>ggtree::ggtree()</code> .

Value

ggplot object.

## End(Not run)

```

read_cisbp

Import CIS-BP motifs.

Description

Import CIS-BP formatted motifs. See <http://cisbp.ccb.utoronto.ca/index.php>. Assumed to be DNA motifs.

Usage

```
read_cisbp(file, skip = 0)
```

Arguments

file	character(1) File name.
skip	numeric(1) If not zero, will skip however many desired lines in the file before starting to read.

Value

list [universalmotif](#) objects.

Author(s)

Benjamin Jean-Marie Tremblay, <b2tremblay@uwaterloo.ca>

read_matrix *Import motifs from raw matrices.*

Description

Import simply formatted motifs.

Usage

```
read_matrix(file, skip = 0, type, positions = "columns",
            alphabet = "DNA", sep = "", headers = TRUE, rownames = FALSE)
```

Arguments

file	character(1) File name.
skip	numeric(1) If not zero, will skip however many desired lines in the file before starting to read.
type	character(1) One of c('PCM', 'PPM', 'PWM', 'ICM'). If missing will try and guess which one.
positions	character(1) One of c('columns', 'rows'). Indicate whether each position within a motif is represented as a row or a column in the file.
alphabet	character(1) One of c('DNA', 'RNA', 'AA'), or a string of letters.
sep	character(1) Indicates how individual motifs are separated.
headers	logical(1), character(1) Indicating if and how to read names.
rownames	logical(1) Are there alphabet letters present as rownames?

Value

list [universalmotif](#) objects.

Author(s)

Benjamin Jean-Marie Tremblay, <b2tremblay@uwaterloo.ca>

```

read_motifs	<i>Import universalmotif formatted motifs.</i>
-------------	--

Description

Import motifs created from [write_motifs\(\)](#). For optimal storage of `universalmotif` class motifs, consider using [saveRDS\(\)](#) and [readRDS\(\)](#). Currently the `universalmotif` format is YAML-based.

Usage

```
read_motifs(file, skip = 0, progress = FALSE, BP = FALSE)
```

Arguments

file	character(1) File name.
skip	numeric(1) If not zero, will skip however many desired lines in the file before starting to read.
progress	logical(1) Show progress.
BP	logical(1) Allows for the use of BiocParallel within read_motifs() . See BiocParallel::register() to change the default backend.

Value

list `universalmotif` objects.

Author(s)

Benjamin Jean-Marie Tremblay, <b2tremblay@uwaterloo.ca>

read_transfac	<i>Import TRANSFAC motifs.</i>
---------------	--------------------------------

Description

Import TRANSFAC formatted motifs. Assumed to be DNA motifs, type PCM. See `system.file("extdata", "transfa")` for an example motif.

Usage

```
read_transfac(file, skip = 0)
```

Arguments

file	character(1) File name.
skip	numeric(1) If not zero, will skip however many desired lines in the file before starting to read.

Value

```

run_meme

Run MEME from within R.

Description

De novo motif discovery via MEME. For a detailed description of the command, see <http://meme-suite.org/doc/meme.html>. For a brief description of the command parameters, run `run_meme()`. Parameters in `run_meme()` which are directly taken from the MEME program are tagged with [MEME].

Usage

```
run_meme(target.sequences, output = NULL, overwrite.dir = FALSE,
         control.sequences = NULL, weights = NULL, text = FALSE,
         brief = 1000, objfun = "classic", test = NULL, use_llr = FALSE,
         shuf = 2, hsfrac = NULL, cefrac = NULL, searchsize = NULL,
         norand = FALSE, csites = 1000, seed = 0, alph = NULL,
         revcomp = FALSE, pal = FALSE, mod = "zoops", nmotifs = 3,
         evt = NULL, nsites = NULL, minsites = NULL, maxsites = NULL,
         wnsites = 0.8, w = NULL, minw = 8, maxw = 50, allw = NULL,
         nomatrim = FALSE, wg = 11, ws = 1, noendgaps = FALSE,
         bfile = NULL, markov_order = 0, psp = NULL, maxiter = 50,
         distance = 0.001, prior = NULL, b = NULL, plib = NULL,
         spfuzz = NULL, spmap = NULL, cons = NULL, p = NULL,
         maxsize = NULL, maxtime = NULL, wd = getwd(),
         logfile = paste0(wd, "/memerun.log"), readsites = TRUE,
         echo = FALSE, verbose = 1, timeout = Inf,
         bin = getOption("meme.bin"))
```

Arguments

target.sequences	<code>XStringSet</code> List of sequences to get motifs from.
output	character(1) Name of the output folder. If NULL, MEME output will be deleted.
overwrite.dir	logical(1) If output is set but already exists, allow over-writing.
control.sequences	<code>XStringSet</code> List of negative sequences. Only used if objfun = c("de", "se").
weights	numeric Vector of numbers between 0 and 1, representing sequence weights.
text	logical(1) [MEME]
brief	numeric(1) [MEME]
objfun	character(1) [MEME]
test	character(1) [MEME]
use_llr	logical(1) [MEME]
shuf	numeric(1) [MEME]
hsfrac	numeric(1) [MEME]
cefrac	numeric(1) [MEME]
searchsize	numeric(1) [MEME]
norand	logical(1) [MEME]
csites	numeric(1) [MEME]
seed	numeric(1) [MEME]
alph	character(1) [MEME]
revcomp	logical(1) [MEME]
pal	logical(1) [MEME]
mod	character(1) [MEME]
nmotifs	numeric(1) [MEME]

minsites	numeric(1) [MEME]
maxsites	numeric(1) [MEME]
wnsites	numeric(1) [MEME]
w	numeric(1) [MEME]
minw	numeric(1) [MEME]
maxw	numeric(1) [MEME]
allw	numeric(1) [MEME]
nomatrim	logical(1) [MEME]
wg	numeric(1) [MEME]
ws	numeric(1) [MEME]
noendgaps	logical(1) [MEME]
bfile	character(1) [MEME]
markov_order	numeric(1) [MEME]

psp	character(1) [MEME]
maxiter	numeric(1) [MEME]
distance	numeric(1) [MEME]
prior	character(1) [MEME]
b	numeric(1) [MEME]
plib	character(1) [MEME]
spfuzz	numeric(1) [MEME]
smap	character(1) [MEME]
cons	character(1) [MEME]
p	numeric(1) [MEME]
maxsize	numeric(1) [MEME]
maxtime	numeric(1) [MEME]
wd	character(1) Working directory to run MEME in.
logfile	character(1) File to dump MEME stderr. If NULL, no logs will be saved.
readsites	logical(1) Read sites from MEME output (from read_meme()).
echo	logical(1) Dump MEME output to console.
verbose	numeric(1) Set verbose = 0 to quiet run_meme() .
timeout	numeric(1) Stop MEME program past timeout (seconds). See processx::run() .
bin	character(1) Location of MEME binary. Alternatively, set this via <code>options(meme.bin = '/path/to/meme/bin')</code> .

Value

list The output file is read with [read_meme\(\)](#).

sample_sites	<i>Generate binding sites from a motif.</i>
--------------	---

Description

Given probabilities for a sequence as represented by a motif, generate random sequences with the same length as the motif.

Usage

```
sample_sites(motif, n = 100, use.freq = 1)
```

Arguments

motif	See <code>convert_motifs()</code> for acceptable formats.
n	numeric(1) Number of sites to generate.
use.freq	numeric(1) If one, use regular motif matrix. Otherwise, use respective multifreq matrix.

Value

[XStringSet](#) object.

Author(s)

Benjamin Jean-Marie Tremblay, <b2tremblay@uwaterloo.ca>

See Also

[create_sequences\(\)](#), [create_motif\(\)](#), [add_multifreq\(\)](#)

Examples

```
motif <- create_motif()
sites <- sample_sites(motif)
```

scan_sequences	<i>Scan sequences for matches to input motifs.</i>
----------------	--

Description

For sequences of any alphabet, scan them using the PWM matrices of a set of input motifs.

Usage

```
scan_sequences(motifs, sequences, threshold = 0.001,
  threshold.type = "pvalue", RC = FALSE, use.freq = 1, verbose = 1,
  progress = TRUE, BP = FALSE)
```

Arguments

motifs	See <code>convert_motifs()</code> for acceptable motif formats.
sequences	XStringSet Sequences to scan. Alphabet should match motif.
threshold	numeric(1) Between 0 and 1. See details.
threshold.type	character(1) One of <code>c('logodds', 'pvalue')</code> . See details.
RC	logical(1) If TRUE, check reverse complement of input sequences.
use.freq	numeric(1) The default, 1, uses the motif matrix (from the <code>motif['motif']</code> slot) to search for sequences. If a higher number is used, then the matching k-let matrix from the <code>motif['multifreq']</code> slot is used. See add_multifreq() .
verbose	numeric(1) Describe progress, from none (0) to very verbose (3).
progress	logical(1) Show progress. Not recommended if <code>BP = TRUE</code> . Set to FALSE if <code>verbose = 0</code> .
BP	logical(1) Allows for the use of BiocParallel within <code>scan_sequences()</code> . See BiocParallel::register() to change the default backend. Setting <code>BP = TRUE</code> is only recommended for exceptionally large jobs. Keep in mind however that this function will not attempt to limit its memory usage. Furthermore, the behaviour of <code>progress = TRUE</code> is changed if <code>BP = TRUE</code> ; the default BiocParallel progress bar will be shown (which unfortunately is much less informative).

Details

Similar to [Biostrings::matchPWM\(\)](#), the scanning method uses logodds scoring. (To see the scoring matrix for any motif, simply run `convert_type(motif, "PWM")`; for a multifreq scoring matrix: `apply(motif["multifreq"]$2, 2, ppm_to_pwm)`). In order to score a sequence, at each position within a sequence of length equal to the length of the motif, the scores for each base are summed. If the score sum is above the desired threshold, it is kept.

If `threshold.type = 'logodds'`, then to calculate the minimum allowed score the total possible score for a motif is multiplied by the value set by `threshold`. To determine the maximum and minimum possible scores a motif (of type PWM), run `sum(apply(motif['motif'], 2, max))` and `sum(apply(motif['motif'], 2, min))`. If `threshold.type = 'pvalue'`, then `threshold logodds scores` are generated using [motif_pvalue\(\)](#).

Non-standard letters (such as "N", "+", "-", ".", etc in `DNASTring` objects) will be safely ignored, resulting only in a warning and a very minor performance cost. This can be used to scan masked sequences. See [Biostrings::mask\(\)](#) for masking sequences (generating `MaskedXString` objects), and [Biostrings::injectHardMask\(\)](#) to recover masked `XStringSet` objects for use with `scan_sequences()`.

Value

`data.frame` with each row representing one hit; if the input sequences are [DNASTringSet](#) or [RNAStringSet](#), then an additional column with the strand is included.

Examples

```
## any alphabet can be used
## Not run:
set.seed(1)
alphabet <- paste(c(letters), collapse = "")
motif <- create_motif("hello", alphabet = alphabet)
sequences <- create_sequences(alphabet, seqnum = 1000, seqlen = 100000)
scan_sequences(motif, sequences)

## End(Not run)

## Sequence masking:
library(Biostrings)
data(ArabidopsisMotif)
data(ArabidopsisPromoters)
seq <- ArabidopsisPromoters[[1]] # Only works for XString, not XStringSet
seq <- mask(seq, pattern = "AAAA") # MaskedDNAString class
seq <- injectHardMask(seq, letter = "+") # Recover XString
seq <- DNASTringSet(seq) # scan_sequences() needs XStringSet
scan_sequences(ArabidopsisMotif, seq, verbose = 0, progress = FALSE)
# A warning regarding the presence of non-standard letters will be given,
# but can be safely ignored in this case.
```

shuffle_motifs

Shuffle motifs by column.

Description

Given a set of motifs, shuffle the columns between them. Currently does not support keeping the 'multifreq' slot. Only the 'bkg', 'nsites', 'strand', and 'bkgsites' slots will be preserved. Uses the same shuffling methods as [shuffle_sequences\(\)](#). When shuffling more than one motif, they are shuffled together.

Usage

```
shuffle_motifs(motifs, k = 2, method = "linear", leftovers = "asis")
```

Arguments

motifs	See convert_motifs() for acceptable formats.
k	numeric(1) K-let size.
method	character(1) One of c('linear', 'random'). Only relevant if k > 1. See details. The 'random' method will be removed in the next minor version.
leftovers	character(1) For method = 'random'. One of c('asis', 'first', 'split', 'discard'). See details.

Value

Motifs. See [convert_motifs\(\)](#) for available output formats.

Author(s)

Benjamin Jean-Marie Tremblay, <b2tremblay@uwaterloo.ca>

See Also

[shuffle_sequences\(\)](#)

shuffle_sequences *Shuffle input sequences.*

Description

Given a set of input sequences, shuffle the letters within those sequences with any k-let size.

Usage

```
shuffle_sequences(sequences, k = 1, method = "euler",
  leftovers = "asis", progress = FALSE, BP = FALSE)
```

Arguments

sequences	XStringSet Set of sequences to shuffle. Works with any set of characters.
k	numeric(1) K-let size.
method	character(1) One of c('euler', 'markov', 'linear', 'random'). Only relevant is k > 1. See details. The 'random' method is deprecated and will be removed in the next minor version.
leftovers	character(1) For method = 'random'. One of c('asis', 'first', 'split', 'discard').
progress	logical(1) Show progress. Not recommended if BP = TRUE.
BP	logical(1) Allows the use of BiocParallel within shuffle_sequences() . See BiocParallel::register() to change the default backend. Setting BP = TRUE is only recommended for large jobs (such as shuffling billions of letters). Furthermore, the behaviour of progress = TRUE is changed if BP = TRUE; the default BiocParallel progress bar will be shown (which unfortunately is much less informative).

Details

If method = 'markov', then the Markov model is used to generate sequences which will maintain (on average) the k-let frequencies. Please note that this method is not a 'true' shuffling, and for short sequences (e.g. <100bp) this can result in slightly more dissimilar sequences versus true shuffling. See Fitch (1983) for a discussion on the topic.

If method = 'euler', then the sequence shuffling method proposed by Altschul and Erickson (1985) is used. As opposed to the 'markov' method, this one preserves exact k-let frequencies. This is done by creating a k-let edge graph, then following a random Eulerian walk through the graph. Not all walks will use up all available letters however, so the cycle-popping algorithm proposed by Propp

and Wilson (1998) is used to find a random Eulerian path. A side effect of using this method is that the starting and ending sequence letters will remain unshuffled.

If `method = 'linear'`, then the input sequences are split linearly every `k` letters; for example, for `k = 3` 'ACAGATAGACCC' becomes 'ACA GAT AGA CCC'; after which these 3-lets are shuffled randomly.

Do note however, that the method parameter is only relevant for `k > 1`. For `k = 1`, a simple sample call is performed.

Value

`XStringSet` The input sequences will be returned with identical names and lengths.

```

switch_alph

Switch between DNA and RNA alphabets.

Description

Convert a motif from DNA to RNA, or RNA to DNA.

Usage

```
switch_alph(motifs)
```

Arguments

`motifs` See `convert_motifs()` for acceptable formats.

Value

The DNA/RNA version of the motifs. See [convert_motifs\(\)](#) for acceptable output formats.

trim_motifs

Trim motifs.

Description

Remove edges of motifs with low information content.

Usage

```
trim_motifs(motifs, min.ic = 0.25)
```

Arguments

motifs	See convert_motifs() for acceptable formats.
min.ic	numeric(1) Minimum allowed information content. See convert_type() for a discussion on information content.

Value

Motifs See [convert_motifs\(\)](#) for available output formats.

## S4 method for signature 'universalmotif'
cbind(..., deparse.level = 0)
```

Arguments

x	universalmotif Motif.
i	character Slot.
value	Object to replace slot with.
.Object	universalmotif Final motif.
name	character(1) Motif name.
altname	character(1) Alternate motif name.
family	character(1) Transcription factor family.
organism	character(1) Species of origin.
motif	matrix Each column represents a position in the motif.
alphabet	character(1) One of c('DNA', 'RNA', 'AA'), or a combined string representing the letters.
type	character(1) One of c('PCM', 'PPM', 'PWM', 'ICM').
icscore	numeric(1) Total information content. Automatically generated.
nsites	numeric(1) Number of sites the motif was constructed from.
pseudocount	numeric(1) Correction to be applied to prevent -Inf from appearing in PWM matrices.
bkg	numeric A vector of probabilities, each between 0 and 1. If higher order backgrounds are provided, then the elements of the vector must be named.
bkgsites	numeric(1) Total number of sites used to find the motif.
consensus	character(1) Consensus string. Automatically generated for 'DNA', 'RNA', and 'AA' alphabets.
strand	character(1) Whether the motif is specific to a certain strand.
pval	numeric(1) P-value associated with motif.
qval	numeric(1) Adjusted P-value associated with motif.
eval	numeric(1) E-value associated with motif.
multifreq	list See add_multifreq() .
extrainfo	character Any other extra information, represented as a named character vector.
object	universalmotif Motif.
select	numeric Columns to keep.
...	universalmotif Motifs.
deparse.level	Unused.

Value

A motif object of class `universalmotif`.

Slots

```

name character(1)
altname character(1)
family character(1)
organism character(1)
motif matrix
alphabet character(1)
type character(1)
icscore numeric(1) Generated automatically.
nsites numeric(1)
pseudocount numeric(1)
bkg numeric 0-order probabilities must be provided for all letters.
bkg sites numeric(1)
consensus character Generated automatically.
strand character(1)
pval numeric(1)
qval numeric(1)
eval numeric(1)
multifreq list
extrainfo character

```

Author(s)

Benjamin Jean-Marie Tremblay, <b2tremblay@uwaterloo.ca>

Examples

```

## [
## Access the slots.
motif <- create_motif()
motif["motif"]
# you can also access multiple slots at once, released as a list
motif[c("motif", "name")]

## [<-
## Replace the slots.
motif["name"] <- "new name"
# some slots are protected
# motif["consensus"] <- "AAAA" # not allowed

## c
## Assemble a list of motifs.
c(motif, motif)

```

```
## as.data.frame
## Represent a motif as a data.frame. The actual motif matrix is lost.
## Necessary for `summarise_motifs`.
as.data.frame(motif)

## subset
## Subset a motif matrix by column.
subset(motif, 3:7) # extract motif core

## normalize
## Apply the pseudocount slot (or `1`, if the slot is set to zero) to the
## motif matrix.
motif2 <- create_motif("AAAAA", nsites = 100, pseudocount = 1)
normalize(motif2)

## rowMeans
## Calculate motif rowMeans.
rowMeans(motif)

## colMeans
## Calculate motif colMeans.
colMeans(motif)

## colSums
## Calculate motif colSums
colSums(motif)

## rowSums
## Calculate motif rowSums.
rowSums(motif)

## nrow
## Count motif rows.
nrow(motif)

## ncol
## Count motif columns.
ncol(motif)

## colnames
## Get motif colnames.
colnames(motif)

## rownames
## Get motif rownames.
rownames(motif)

## cbind
## Bind motifs together to create a new motif.
cbind(motif, motif2)
```

Description

universalmotif: Import, Modify and Export Motifs with R

Details

A collection of utility functions for working with motifs.

utilities	<i>Utility functions.</i>
-----------	---------------------------

Description

Utility functions have been split into two categories: those related to motifs ?utils-motif, and those related to sequences ?utils-sequence.

Author(s)

Benjamin Jean-Marie Tremblay, <b2tremblay@uwaterloo.ca>

See Also

utils-motif	<i>Motif-related utility functions.</i>
-------------	---

Description

Motif-related utility functions.

Usage

```
consensus_to_ppm(letter)
```

```
consensus_to_ppmAA(letter)
```

```
get_consensus(position, alphabet = "DNA", type = "PPM",  
pseudocount = 1)
```

```
get_consensusAA(position, type = "PPM", pseudocount = 0)
```

```
get_matches(motif, score)
```

```
icm_to_ppm(position)
```

```
make_DBscores(db.motifs, method, shuffle.db = TRUE, shuffle.k = 3,  
shuffle.method = "linear", shuffle.leftovers = "asis",  
rand.tries = 1000, normalise.scores = TRUE, min.overlap = 6,  
min.mean.ic = 0, progress = TRUE, BP = FALSE)
```

```

motif_score(motif, threshold = c(0, 1))

pcm_to_ppm(position, pseudocount = 0)

position_icscore(position, bkg = 0, type = "PPM", pseudocount = 1,
  nsites = 100, relative_entropy = FALSE)

ppm_to_icm(position, bkg, schneider_correction = FALSE, nsites = 100,
  relative_entropy = FALSE)

ppm_to_pcm(position, nsites = 100)

ppm_to_pwm(position, bkg, pseudocount = 1, nsites = 100,
  smooth = TRUE)

pwm_to_ppm(position, bkg)

score_match(motif, match)

summarise_motifs(motifs, na.rm = TRUE)

```

Arguments

letter	character(1) Any DNA, RNA, or AA IUPAC letter. Ambiguity letters are accepted.
position	numeric A numeric vector representing the frequency or probability for each alphabet letter at a specific position.
alphabet	character(1) One of c('DNA', 'RNA').
type	character(1) One of c('PCM', 'PPM', 'PWM', 'ICM').
pseudocount	numeric(1) Used to prevent zeroes in motif matrix.
motif	Motif object to calculate scores from.
score	numeric(1) Logodds motif score.
db.motifs	list Database motifs.
method	character(1) One of c('PCC', 'MPCC', 'EUCL', 'MEUCL', 'SW', 'MSW', 'KL', 'MKL'). See compare_motifs() .
shuffle.db	logical(1) Shuffle db.motifs rather than generate random motifs with create_motif() .
shuffle.k	numeric(1) See shuffle_motifs() .
shuffle.method	character(1) See shuffle_motifs() .
shuffle.leftovers	character(1) See shuffle_motifs() .
rand.tries	numeric(1) Number of random motifs to create for P-value computation.
normalise.scores	logical(1) See compare_motifs() .
min.overlap	numeric(1) Minimum required motif overlap. See compare_motifs() .
min.mean.ic	numeric(1) See compare_motifs() .
progress	logical(1) Show progress. Not recommended if BP = TRUE.

BP	logical(1) Use the BiocParallel package. See <code>BiocParallel::register()</code> to change the default backend.
threshold	numeric(1) Any number of numeric values between 0 and 1 representing score percentage.
bkg	Numeric Should be the same length as the alphabet length.
nsites	numeric(1) Number of sites motif originated from.
relative_entropy	logical(1) Calculate information content as relative entropy or Kullback-Leibler divergence.
schneider_correction	logical(1) Apply sample size correction.
smooth	logical(1) Apply pseudocount correction.
match	character(1) Sequence string to calculate score from.
motifs	list A list of <code>universalmotif</code> motifs.
na.rm	logical Remove columns where all values are NA.

Value

For `consensus_to_ppm()` and `consensus_to_ppmAA()`: a numeric vector of length 4 and 20, respectively.

For `get_consensus()` and `get_consensusAA()`: a character vector of length 1.

For `get_matches()`: a character vector of motif matches.

For `make_DBScores()`: a data.frame with score distributions for the input database.

For `motif_score()`: a named numeric vector of motif scores.

For `position_icscore()`: a numeric vector of length 1.

For `ppm_to_icm()`, `icm_to_ppm()`, `pcm_to_ppm()`, `ppm_to_pcm()`, `ppm_to_pwm()`, and `pwm_to_ppm()`: a numeric vector with length equal to input numeric vector.

For `score_match()`: a numeric vector with the match motif score.

For `summarise_motifs()`: a data.frame with columns representing the `universalmotif` slots.

summarise_motifs(list(m1, m2, m3))
```

utils-sequence *Sequence-related utility functions.*

Description

Sequence-related utility functions.

Usage

```
get_klets(lets, k = 1L)
```

```
count_klets(string, k = 1)
```

```
shuffle_string(string, k = 1, method = c("euler", "linear", "markov"))
```

Arguments

lets	character	A character vector where each element will be considered a single unit.
k	integer(1)	K-let size.
string	character(1)	A string of characters.
method	character(1)	Shuffling method. One of c("euler", "linear", "markov"). See shuffle_sequences() .

Value

For [count_klets\(\)](#): A data.frame with columns lets and counts.

For [get_klets\(\)](#): A character vector of k-lets.

For [shuffle_string\(\)](#): A single character string.

Author(s)

Benjamin Jean-Marie Tremblay, <b2tremblay@uwaterloo.ca>

See Also

[create_sequences\(\)](#), [shuffle_sequences\(\)](#)

Examples

```
#####
## count_klets
## Count k-lets for any string of characters
count_klets("GCAAATGTACGCAGGGCCGA", k = 2)
## The default 'k' value (1) counts individual letters
count_klets("GCAAATGTACGCAGGGCCGA")

#####
## get_klets
## Generate all possible k-lets for a set of characters
get_klets(c("A", "C", "G", "T"), 3)
```

```
## Note that each element in 'lets' is considered a single unit;
## see:
get_klets(c("AA", "B"), k = 2)

#####
## shuffle_string
## Shuffle any string of characters
shuffle_string("ASDADASDASDASD", k = 2)
```

view_motifs

Plot motif logos.

Description

Show sequence logo. If given a list of more than one motif, then the motifs are aligned with the first in the list.

Usage

```
view_motifs(motifs, use.type = "ICM", method = "MPCC", tryRC = TRUE,
  min.overlap = 6, min.mean.ic = 0.5, relative_entropy = FALSE,
  normalise.scores = FALSE, ...)
```

Arguments

motifs	See convert_motifs() for acceptable motif formats.
use.type	character(1) One of c('PCM', 'PPM', 'PWM', 'ICM').
method	character(1) One of c('PCC', 'MPCC', 'EUCL', 'MEUCL', 'SW', 'MSW', 'KL', 'MKL'). See compare_motifs() .
tryRC	logical(1) Check if motif reverse complement leads to a better alignment. See compare_motifs() .
min.overlap	numeric(1) Minimum alignment overlap between motifs. If <code>min.overlap < 1</code> , this represents the minimum fraction between the two motifs during alignment. See compare_motifs() .
min.mean.ic	numeric(1) Minimum information content between the two motifs for an alignment to be scored. This helps prevent scoring alignments between low information content regions of two motifs. See compare_motifs() .
relative_entropy	logical(1) For ICM calculation. See convert_type() .
normalise.scores	logical(1) Favour alignments which leave fewer unaligned positions. See compare_motifs() .
...	Additional options for <code>ggseqlogo::geom_logo()</code> .

Details

Since the **ggseqlogo** package can only plot individual characters and not strings, plotting the multifreq slot is not supported. See the examples section for plotting the multifreq slot using the **Logolas** package.

Value

A ggplot object.

                   color_type = "per_symbol")

## End(Not run)
```

write_homer

Export motifs in HOMER format.

Description

Convert DNA motifs to HOMER format and write to file. See <http://homer.ucsd.edu/homer/motif/>.

Usage

```
write_homer(motifs, file, logodds_threshold = 0.6, overwrite = FALSE,
            append = FALSE)
```

Arguments

motifs	See convert_motifs() for acceptable formats.
file	character(1) File name.
logodds_threshold	numeric Stringency required for HOMER to match a motif. See scan_sequences() .
overwrite	logical(1) Overwrite existing file.
append	logical(1) Add to an existing file.

Value

NULL, invisibly.

Author(s)

Benjamin Jean-Marie Tremblay, <b2tremblay@uwaterloo.ca>

References

Examples

```
motif <- create_motif()
write_homer(motif, tempfile())
```

write_jaspar	<i>Export motifs in JASPAR format.</i>
--------------	--

Description

Convert motifs to JASPAR format and write to file. See <http://jaspar.genereg.net/>.

Usage

```
write_jaspar(motifs, file, overwrite = FALSE, append = FALSE)
```

Arguments

motifs	See convert_motifs() for acceptable formats.
file	character(1) File name.
overwrite	logical(1) Overwrite existing file.
append	logical(1) Add to an existing file.

Value

NULL, invisibly.

Examples

```
transfac <- read_transfac(system.file("extdata", "transfac.txt",
                                     package = "universalmotif"))
write_jaspar(transfac, tempfile())
```

write_matrix	<i>Export motifs as raw matrices.</i>
--------------	---------------------------------------

Description

Write motifs as simple matrices with optional headers to file.

Usage

```
write_matrix(motifs, file, positions = "columns", rownames = FALSE,
            type, sep = "", headers = TRUE, overwrite = FALSE,
            append = FALSE)
```

Arguments

motifs	See convert_motifs() for acceptable formats.
file	character(1) File name.
positions	character(1) One of c('columns', 'rows').
rownames	logical(1) Include alphabet letters as rownames.
type	character(1) One of c('PCM', 'PPM', 'PWM', 'ICM'). If missing will use whatever type the motif is currently stored as.
sep	character(1) Indicates how to separate individual motifs.
headers	logical(1), character(1) Indicating if and how to write names.
overwrite	logical(1) Overwrite existing file.
append	logical(1) Add to an existing file.

Value

NULL, invisibly.

Author(s)

Benjamin Jean-Marie Tremblay, <b2tremblay@uwaterloo.ca>

Other write_motifs: [write_homer](#), [write_jaspar](#), [write_meme](#), [write_motifs](#), [write_transfac](#)

Examples

```
motif <- create_motif()
write_matrix(motif, tempfile(), headers = ">")
```

write_meme

Export motifs in MEME format.

Description

Convert motifs to minimal MEME format and write to file. See <http://meme-suite.org/doc/meme-format.html>.

Usage

```
write_meme(motifs, file, version = 5, bkg, strand, overwrite = FALSE,
           append = FALSE)
```

Arguments

motifs	See convert_motifs() for acceptable formats.
file	character(1) File name.
version	numeric(1) MEME version.
bkg	numeric Background letter frequencies. If missing, will use background frequencies from motif objects (if they are identical); else background frequencies will be set to freq = 1/length(alphabet)
strand	character If missing, will use strand from motif objects (if identical); otherwise will default to "+ -"
overwrite	logical(1) Overwrite existing file.
append	logical(1) Add to an existing file. Motifs will be written in minimal format, so it is recommended to only use this if the existing file is also a minimal MEME format file.

Value

NULL, invisibly.

[read_meme\(\)](#)

Other write_motifs: [write_homer](#), [write_jaspar](#), [write_matrix](#), [write_motifs](#), [write_transfac](#)

Examples

```
transfac <- read_transfac(system.file("extdata", "transfac.txt",
                                     package = "universalmotif"))
write_meme(transfac, tempfile())
```

write_motifs

Export motifs in universalmotif format.

Description

Write motifs as universalmotif objects to file. For optimal storage of universalmotif class motifs, consider using [saveRDS\(\)](#) and [readRDS\(\)](#). Currently the universalmotif format is YAML-based.

Usage

```
write_motifs(motifs, file, minimal = FALSE, multifreq = TRUE,
             progress = FALSE, overwrite = FALSE, append = FALSE, BP = FALSE)
```

Arguments

motifs	See convert_motifs() for acceptable formats.
file	character(1) File name.
minimal	logical(1) Only write essential motif information.
multifreq	logical(1) Write multifreq slot, if present.
progress	logical(1) Show progress.
overwrite	logical(1) Overwrite existing file.
append	logical(1) Add to an existing motif file. Package version in existing motif file must be greater than 1.2.0.
BP	logical(1) Allows for the use of BiocParallel within write_motifs() . See BiocParallel::register() to change the default backend.

Value

NULL, invisibly.

Author(s)

Benjamin Jean-Marie Tremblay, <b2tremblay@uwaterloo.ca>

write_transfac	<i>Export motifs in TRANSFAC format.</i>
----------------	--

Description

Convert motifs to TRANSFAC format and write to file.

Usage

```
write_transfac(motifs, file, overwrite = FALSE, append = FALSE)
```

Arguments

motifs	See convert_motifs() for acceptable formats.
file	character(1) File name.
overwrite	logical(1) Overwrite existing file.
append	logical(1) Add to an existing file.

Value

NULL, invisibly.
