

# Package ‘ivygapSE’

May 17, 2024

**Title** A SummarizedExperiment for Ivy-GAP data  
**Description** Define a SummarizedExperiment and exploratory app for Ivy-GAP glioblastoma image, expression, and clinical data.  
**Version** 1.26.0  
**Author** Vince Carey  
**Suggests** knitr, png, limma, grid, DT, randomForest, digest, testthat, rmarkdown, BiocStyle, magick, statmod, codetools  
**Depends** R (>= 3.5.0), SummarizedExperiment  
**Imports** shiny, survival, survminer, hwriter, plotly, ggplot2, S4Vectors, graphics, stats, utils, UpSetR  
**Maintainer** VJ Carey <stvjc@channing.harvard.edu>  
**License** Artistic-2.0  
**LazyLoad** yes  
**biocViews** Transcription, Software, Visualization, Survival, GeneExpression, Sequencing  
**RoxygenNote** 7.2.3  
**VignetteBuilder** knitr  
**git\_url** <https://git.bioconductor.org/packages/ivygapSE>  
**git\_branch** RELEASE\_3\_19  
**git\_last\_commit** 7c4e7c1  
**git\_last\_commit\_date** 2024-04-30  
**Repository** Bioconductor 3.19  
**Date/Publication** 2024-05-16

|                |                               |
|----------------|-------------------------------|
| designOverview | <i>render design overview</i> |
|----------------|-------------------------------|

---

### Description

render design overview  
 render anatomic nomenclature

### Usage

```
designOverview()
nomenclat()
```

### Value

a rastergrob grob

### Examples

```
designOverview()
```

---

|            |   |
|------------|---|
| exprByType | <i>simple plot of expression values by structure/expression-based selection in IvyGAP</i> |
|------------|---|

---

### Description

simple plot of expression values by structure/expression-based selection in IvyGAP

### Usage

```
exprByType(sym, ...)
```

### Arguments

|     |   |
|-----|---|
| sym | a gene symbol found among 'rownames(ivySE)'   |
| ... | passed to plot, exclusive of ylab, xlab, axes |

**Value**

invisibly returns a list with two elements: `exprs`, the vector of expression values, and `types`, the vector of structure types

**Examples**

```
exprByType("MYC")
```

---

|             |   |
|-------------|---|
| getRefLimma | <i>provide access to a limma analysis of RNA-seq profiles for reference histology samples</i> |
|-------------|---|

---

**Description**

provide access to a limma analysis of RNA-seq profiles for reference histology samples

**Usage**

```
getRefLimma()
```

**Value**

an instance of [MArrayLM-class](#) representing regularized gene-wise ANOVAs

**Note**

Uses [download.file](#) to acquire RDS of the output of [eBayes](#) from a public S3 bucket. The limma model was fit using [duplicateCorrelation](#) to address multiplicity of contributions per donor. Comparisons are to samples labeled CT-reference (cellular tumor, reference contributions), with coefficients 2-5 corresponding to CT-mvp (microvascular proliferation), CT-pan (pseudopalisading cells around necrosis), IT (infiltrating tumor), and LE (leading edge), respectively.

**Examples**

```
requireNamespace("limma")
ebout = getRefLimma() # is result of eBayes
colnames(ebout$coef)
limma::topTable(ebout,2)
```

---

|            |  |
|------------|--|
| ivyGlimpse | <i>simple app to explore image property quantifications in relation to survival and expression</i> |
|------------|--|

---

**Description**

simple app to explore image property quantifications in relation to survival and expression

**Usage**

```
ivyGlimpse()
```

**Value**

Side effect of starting the app only.

**Examples**

```
if (interactive()) print(ivyGlimpse())
```

---

|       |   |
|-------|---|
| ivySE | <i>ivySE: SummarizedExperiment for IvyGAP expression data and meta-data</i> |
|-------|---|

---

**Description**

ivySE: SummarizedExperiment for IvyGAP expression data and metadata

**Usage**

```
ivySE
```

**Format**

SummarizedExperiment instance

**Details**

Archive: gene\_expression\_matrix\_2014-11-25.zip

| Length   | Date       | Time  | Name                |

Expression data retrieved from [http://glioblastoma.alleninstitute.org/api/v2/well\\_known\\_file\\_download/305873915](http://glioblastoma.alleninstitute.org/api/v2/well_known_file_download/305873915)

**Source**

processed from [glioblastoma.alleninstitute.org](http://glioblastoma.alleninstitute.org); see Note.

**Examples**

```
## Not run: # how it was made
ivyFpkm = read.csv("fpkm_table.csv", stringsAsFactors=FALSE,
  check.names=FALSE)
g = read.csv("rows-genes.csv", stringsAsFactors=FALSE)
library(SummarizedExperiment)
imat = data.matrix(ivyFpkm[,-1])
ivySE = SummarizedExperiment(SimpleList(fpkm=imat))
rowData(ivySE) = g
rownames(ivySE) = g$gene_symbol
col = read.csv("columns-samples.csv", stringsAsFactors=FALSE)
rownames(col) = col$rna_well_id
stopifnot(all.equal(as.character(col$rna_well_id),
  as.character(colnames(imat))))
colData(ivySE) = DataFrame(col)
colnames(ivySE) = colnames(imat)
metadata(ivySE) = list(README=readLines("README.txt"))
# metadata(ivySE)$URL = "http://glioblastoma.alleninstitute.org/static/download.html"
# metadata(ivySE)$builder = readLines("build.R")
de = read.csv("tumor_details.csv", stringsAsFactors=FALSE)
metadata(ivySE)$tumorDetails = de
subbl = read.csv("sub_block_details.csv", stringsAsFactors=FALSE)
metadata(ivySE)$subBlockDetails = subbl
bamtab = read.csv("bam.csv", stringsAsFactors=FALSE)
rownames(bamtab) = as.character(bamtab$rna_well)
bamtab[colnames(ivySE),] -> bamtreeo
all.equal(rownames(bamtreeo), colnames(ivySE))
colData(ivySE) = cbind(colData(ivySE), bamtreeo)

## End(Not run)
data(ivySE)
names(metadata(ivySE))
```

---

makeGeneSets

*demonstration of gene set construction for ivyGlimpse app*

---

**Description**

demonstration of gene set construction for ivyGlimpse app

**Usage**

```
makeGeneSets()
```

**Value**

list of gene sets with attributes facilitating dropdown construction – attr(,"fullTitle") is a list of strings associated with gene set elements (named list with vectors of gene symbols constituting sets of interest)

List of 4

\$ General: Ras-Raf-MEK-Erk/JNK signaling (26 genes)

: chr [1:26] "KRAS" "HRAS" "BRAF" "RAF1" ...

\$ Glioblastoma: RTK/Ras/PI3K/AKT Signaling (17 genes)

: chr [1:17] "EGFR" "ERBB2" "PDGFRA" "MET" ...

\$ General: PI3K-AKT-mTOR signaling (17 genes)

: chr [1:17] "PIK3CA" "PIK3R1" "PIK3R2" "PTEN" ...

\$ Ovarian Cancer: Putative tumor-suppressor genes in epithelial ovarian cancer (16 genes)

: chr [1:16] "DIRAS3" "RASSF1" "DLEC1" "SPARC" ...

- attr(\*, "fullTitle")=List of 4

..\$ glioRTK : chr "Glioblastoma: RTK/Ras/PI3K/AKT Signaling (17 genes)"

..\$ pi3k : chr "General: PI3K-AKT-mTOR signaling (17 genes)"

..\$ ovtumsupp: chr "Ovarian Cancer: Putative tumor-suppressor genes in epithelial ovarian cancer (16 genes)"

..\$ rasraf : chr "General: Ras-Raf-MEK-Erk/JNK signaling (26 genes)"

**Note**

Should be replaced by selections from a general catalog.

**Examples**

```
str(makeGeneSets())
```

---

tumorDetails

*helper functions for data access*

---

**Description**

helper functions for data access

**Usage**

```
tumorDetails(se)
```

```
subBlockDetails(se)
```

```
vocab()
```

**Arguments**

se SummarizedExperiment instance, intended to work for ivySE in this package

**Value**

data.frames for tumorDetails, subBlockDetails and vocab

**Examples**

```
data(ivySE)
dim(tumorDetails(ivySE))
```
