Package ‘NormqPCR’

March 26, 2024

Version 1.49.0
Date 2018-07-09
Title Functions for normalisation of RT-qPCR data
Description Functions for the selection of optimal reference genes and the normalisation of real-time quantitative PCR data.
Author Matthias Kohl, James Perkins, Nor Izayu Abdul Rahman
Maintainer James Perkins <jimrperkins@gmail.com>
Depends R(>= 2.14.0), stats, RColorBrewer, Biobase, methods, ReadqPCR, qpcR

NormqPCR-package

Functions for normalisation of RT-qPCR data.

Description

Functions for normalisation of real-time quantitative PCR data.

Details

Package: NormqPCR
Type: Package
Version: 1.7.1
Date: 2014-08-13
Depends: R(>= 2.14.0), stats, RColorBrewer, Biobase, methods, ReadqPCR, qpcR
Imports: ReadqPCR
biocViews: MicrotitrePlateAssay, GeneExpression, qPCR
License: LGPL-3
LazyLoad: yes
LazyData: yes

## End(Not run)
```

---

**Bladder**

**Bladder dataset of Andersen et al (2004)**

**Description**

This dataset was used in Andersen et al (2004) to demonstrate normalization of real-time quantitative RT-PCR data by geometric averaging of housekeeping genes.

**Usage**

```r
data(Bladder)
```

**Format**

A `qPCRBatch` object which contains an expression matrix with the expression of 14 genes measured in 28 samples. The sample information is saved in the `phenoData` slot with variables

- **Sample.no.** sample number.
- **Grade** Grade of bladder cancer.
The following information on the measured genes is saved in the variables Symbol and Gene.name of the featureData slot.

**ATP5B** ATP synthase, H+ transporting, mitochondrial F1 complex, beta polypeptide.

**HSPCB** Heat shock 90-kDa protein 1, beta.

**S100A6** S100 calcium-binding protein A6 (calcylin).

**FLOT2** Flotillin 2.

**TEGR** Testis enhanced gene transcript (BAX inhibitor 1).

**UBB** Ubiquitin B.

**TPT1** Tumor protein, translationally controlled 1.

**CFL1** Cofilin 1 (non-muscle).

**ACTB** Actin, beta.

**RPS23** Ribosomal protein S23.

**GAPD** Glyceraldehyde-3-phosphate dehydrogenase.

**UBC** Ubiquitin C.

**FLJ20030** Hypothetical protein FLJ20030.

For a detailed annotation see Table 1 in Anderson et al. (2004).

**Details**

The genes included in this data set were selected by screening 99 bladder sample expression profiles.

**Source**

The data set was obtained from [http://www.mdl.dk/Publications_sup1.htm](http://www.mdl.dk/Publications_sup1.htm)

**References**

**Examples**

```r
data(Bladder)
Bladder
head(exprs(Bladder))
pData(Bladder)
fData(Bladder)
```
**Description**

This dataset was used in Andersen et al (2004) to demonstrate normalization of real-time quantitative RT-PCR data by geometric averaging of housekeeping genes.

**Usage**

data(BladderRepro)

**Format**

A qPCRBatch object which contains an expression matrix with the expression of 8 genes measured in 26 samples. The sample information is saved in the phenoData slot with variables

- **Sample.no.** sample number.
- **Grade** Grade of bladder cancer.

The following information on the measured genes is saved in the variables `Symbol` and `Gene.name` of the featureData slot.

- **CD14** CD14 antigen.
- **FCN1** Ficolin (collagen/fibrinogen domain containing) 1.
- **CCNG2** Cyclin G2.
- **NPAS2** Neuronal PAS domain protein 2.
- **UBC** Ubiquitin C.
- **CFL1** Cofilin 1 (non-muscle).
- **ACTB** Actin, beta.
- **GAPD** Glyceraldehyde-3-phosphate dehydrogenase.

For a detailed annotation see Table 1 and Supplementary table 1 in Anderson et al. (2004).

**Details**

This data set was used to check the reproducibility of the results obtained in Andersen et al (2004).

**Source**

The data set was obtained from http://www.mdl.dk/Publications_sup1.htm

BladderRepro
head(exprs(BladderRepro))
pData(BladderRepro)
fData(BladderRepro)
```

---

**Colon**

**Colon dataset of Andersen et al (2004)**

Description

This dataset was used in Andersen et al (2004) to demonstrate normalization of real-time quantitative RT-PCR data by geometric averaging of housekeeping genes.

Usage

```r
data(Colon)
```

Format

A qPCRBatch object which contains an expression matrix with the expression of 13 genes measured in 40 samples. The sample information is saved in the phenoData slot with variables

- **Sample.no.** sample number.
- **Classification** Classification of colon cancer.

The following information on the measured genes is saved in the variables **Symbol** and **Gene.name** of the featureData slot.

- **UBC** Ubiquitin C.
- **UBB** Ubiquitin B.
- **SUI1** Putative translation initiation factor.
- **NACA** Nascent-polypeptide-associated complex alpha polypeptide.
- **FLJ20030** Hypothetical protein FLJ20030.
- **CFL1** Cofilin 1 (non-muscle).
- **ACTB** Actin, beta.
- **CLTC** Clathrin, heavy polypeptide (Hc).
- **RPS23** Ribosomal protein S23.
- **GAPD** Glyceraldehyde-3-phosphate dehydrogenase.
- **TPT1** Tumor protein, translationally controlled 1.
- **TUBA6** Tubulin alpha 6.

For a detailed annotation see Table 1 in Anderson et al. (2004).
Details

The genes included in this data set were selected by screening 161 colon sample expression profiles.

Source

The data set was obtained from [http://www.mdl.dk/Publications_sup1.htm](http://www.mdl.dk/Publications_sup1.htm)

```

### combineTechReps

**Combine Technical Replicates**

**Description**

Takes expression set of qPCR values containing technical replicates and combines them.

**Usage**

```r
combineTechReps(qPCRBatch, ...)
```

## S4 method for signature 'qPCRBatch'

```r
combineTechReps(qPCRBatch, calc="arith")
```

**Arguments**

- `qPCRBatch` Expression set containing qPCR data, read in by a ReadqPCR function and containing technical reps, denoted by `_TechRep.n` suffix.
- `...` Extra arguments, detailed below
- `calc` use median, arithmetic or geometric mean for combining the values

**Details**

Takes `exprs` of qPCR values containing technical replicates and combines them using a specified centrality measure.
combineTechRepsWithSD

Value

qPCRBatch with same number of samples, but with less features, since all technical replicates are replaced with a single value of their means.

Author(s)

James Perkins <jimrperkins@gmail.com>

References

Examples

```r
path <- system.file("exData", package = "NormqPCR")
qPCR.example.techReps <- file.path(path, "qPCR.techReps.txt")
qPCRBatch.qPCR.techReps <- read.qPCR(qPCR.example.techReps)
rownames(exprs(qPCRBatch.qPCR.techReps))
combinedTechReps <- combineTechReps(qPCRBatch.qPCR.techReps)
rownames(exprs(combinedTechReps))
```

combineTechRepsWithSD  Combines Technical Replicates

Description

Takes expression set of qPCR values containing technical replicates and combines them. In addition the appropriate standard deviation (SD) is computed.

Usage

```r
combineTechRepsWithSD(qPCRBatch, ...)
```

## S4 method for signature 'qPCRBatch'

```r
combineTechRepsWithSD(qPCRBatch, calc="arith")
```

Arguments

- **qPCRBatch**  
  Expression set containing qPCR data, read in by a ReadqPCR function and containing technical reps, denoted by _TechRep.n suffix.

- **...**  
  Extra arguments, detailed below

- **calc**  
  use median, arithmetic or geometric mean for combining the values
**Details**

Takes `exprs` of qPCR values containing technical replicates and combines them using a specified centrality measure.

The arithmetic mean (calc="arith") is combined with the classical standard deviation. In case of the geometric mean (calc="geom") the classical standard deviation of the log-values is exponentiated. The median (calc="median") is calculated in connection with the MAD.

**Value**

qPCRBatch with same number of samples, but with less features, since all technical replicates are replaced with a single value of their means. In addition the slot assayData includes a matrix with SD values which can be accessed via `se.exprs`.

**Author(s)**

Matthias Kohl <Matthias.Kohl@stamats.de>

`combineTechReps`

**Examples**

```r
path <- system.file("exData", package = "NormqPCR")
qPCR.example.techReps <- file.path(path, "qPCR.techReps.txt")
qPCRBatch.qPCR.techReps <- read.qPCR(qPCR.example.techReps)
rownames(exprs(qPCRBatch.qPCR.techReps))
combinedTechReps <- combineTechRepsWithSD(qPCRBatch.qPCR.techReps)
rownames(exprs(combinedTechReps))
exprs(combinedTechReps)
se.exprs(combinedTechReps)
```

**Description**

This function computes normalized relative quantities (NRQs) for a qPCRBatch.
Usage
ComputeNRQs(qPCRBatch, ...)
## S4 method for signature 'qPCRBatch'
ComputeNRQs(qPCRBatch, hkg)

Arguments
qPCRBatch an object of class qPCRBatch.
hkg Names of reference/housekeeping genes.
... other parameters to be passed to downstream methods.

Details
Allows the user to normalized relative quantities as defined in Hellemans et al. (2007).

Value
Object of class "qPCRBatch".

Author(s)
Nor Izayu Abdul Rahman, Matthias Kohl <Matthias.Kohl@stamats.de>

References
Jan Hellemans, Geert Mortier, Anne De Paepe, Frank Speleman and Jo Vandesompele (2007). qBase relative quantification framework and software for management and automated analysis of real-time quantitative PCR data. *Genome Biology*, 8:R19

Examples
## Example data
path <- system.file("exData", package = "ReadqPCR")
qPCR.example <- file.path(path, "qPCR.example.txt")
Cq.data <- read.qPCR(qPCR.example)

## combine technichal replicates
Cq.data1 <- combineTechRepsWithSD(Cq.data)

## add efficiencies
Effs <- file.path(path, "Efficiencies.txt")
Cq.effs <- read.table(file = Effs, row.names = 1, header = TRUE)
CqValues <- ComputeNRQs(Cq.data1, hkgs = c("gene_az", "gene_gx"))

## NRQs
exprs(res)
## SD of NRQs
se.exprs(res)

CqValues

Compute Cq value and amplification efficiency

Description

This function calculates Cq value and amplification efficiency for a CyclesSet. It is based on function `pcrbatch` of package `qpcR`.

Usage

CqValues(object, ...)

## S4 method for signature 'CyclesSet'
CqValues(object, Effmethod = "expfit", group = NULL,
  model = l5, check = "uni2", checkPAR = parKOD(),
  remove = "none", exclude = NULL, type = "cpD2",
  labels = NULL, norm = FALSE, baseline = NULL,
  basefac = 1, smooth = NULL,
  smoothPAR = list(span = 0.1),
  factor = 1, opt = FALSE,
  optPAR = list(sig.level = 0.05, crit = "ftest"),
  plot = FALSE, verbose = FALSE, ...)

Arguments

object an object of class CyclesSet.
Effmethod a character vector defining the methods for computing amplification efficiency.
group a vector containing the grouping for possible replicates.
model the model to be used for all runs. Default model is l5.
check the method for kinetic outlier detection in KOD. Method "uni2" is set as default which is a test on sigmoidal structure.
checkPAR parameters to be supplied to the check method. See parKOD.
remove indicates which runs to be removed. Either none of them, those which failed to fit or from the outlier methods.
exclude indicates samples to be excluded from calculation, either "" for samples with missing column names or a regular expression defining columns (samples); see 'Details' and 'Examples' in modlist.
type  the point on the amplification curve which is used for efficiency estimation; see efficiency.
labels a vector containing labels which define replicate groups. See more details in pcrbatch and ratiobatch.
norm  a logical value which determines whether the raw data should be normalized within \([0, 1]\) before model fitting or not.
baseline type of baseline subtraction. More details in efficiency.
basefac a factor when using averaged baseline cycles, such as \(0.95\).
smooth the curve smoothing method. See more details in pcrbatch.
smoothPAR parameters to be supplied to smoothing method in smooth.
factor a multiplication factor for the fluorescence response values.
opt a logical value which determines whether model selection should be applied to each model or not.
optPAR parameters to be supplied for model selection in mselect.
plot a logical value. If TRUE, the single runs are plotted from the internal modlist for diagnostics.
verbose a logical value. If TRUE, fitting and tagging results will be displayed in the console.
... other parameters to be passed to downstream methods.

Details

Allows the user to compute Cq value and amplification efficiency. In addition, all values generated during the computations are saved. This function has four choices of methods for computing amplification efficiency values which are the methods provided by package qpcR.

More details on technical replication and normalization is given in the vignette NormqPCR.

Value

Object of class "qPCRBatch".

effs(res2)
se.effs(res2)

## 3) use window of linearity
res3 <- CqValues(cycData1, Effmethod = "sliwin")
res3
effs(res3)
se.effs(res3)

## 4) linear regression of efficiency
res4 <- CqValues(cycData1, Effmethod = "LRE")
res4
effs(res4)
se.effs(res4)
```

Description

Normalise qPCR eset using a given housekeeping gene as control, then perform differential expression analysis using the delta delta Ct method

Usage

deltaCt(qPCRBatch, ...)

## S4 method for signature 'qPCRBatch'

deltaCt(qPCRBatch, hkgs, combineHkgs=FALSE, calc="arith")
deltaCq(qPCRBatch, hkgs, combineHkgs=FALSE, calc="arith")

### Arguments

- **qPCRBatch**: qPCR-specific expression set, containing qPCR data.
- **hkgs**: String containing the name of the name of the housekeeping gene which will be used to normalise the rest of the genes.
- **combineHkgs**: Logical - if TRUE, then as long as more than one housekeeper given for argument hkgs, it will combine the housekeepers by finding the geometric mean. Housekeepers can be found using geNorm or NormFinder algorithms.
- **calc**: use arithmetic or geometric mean.

### Details

Takes expression set of qPCR values and normalises them using a housekeeping gene. Returns a qPCRBatch with exprs set of the same dimensions but with the given hkg value subtracted.

### Value

qPCRBatch with exprs set of the same dimensions but with the given hkg value subtracted.

### Author(s)

James Perkins <jimrperkins@gmail.com>

### References

### See Also

- selectHKs, deltaDeltaCq

### Examples

```r
path <- system.file("exData", package = "NormqPCR")
taqlman.example <- file.path(path, "example.txt")
qPCRBatch.taqman <- read.taqman(taqlman.example)
hkgs<="Actb-Rn00667869_m1"
qPCRBatch.norm <- deltaCq(qPCRBatch = qPCRBatch.taqman, hkgs = hkgs, calc="arith")
head(exprs(qPCRBatch.norm))
```
deltaDeltaCt

Perform normalization and differential expression with given housekeeping gene

Description

Normalise qPCRBatch RT-qPCR data using housekeeping genes as control, then perform differential expression analysis using the delta delta Cq method.

Usage

deltaDeltaCt(qPCRBatch,...)

## S4 method for signature 'qPCRBatch'
deltaDeltaCt(qPCRBatch, maxNACase=0, maxNAControl=0, hkgs, contrastM, case, control, paired=TRUE, hkgCalc="arith", statCalc="arith")
deltaDeltaCq(qPCRBatch, maxNACase=0, maxNAControl=0, hkgs, contrastM, case, control, paired=TRUE, hkgCalc="arith", statCalc="arith")

Arguments

- **qPCRBatch**: qPCR-specific expression set, containing qPCR data.
- **...**: Extra arguments, detailed below.
- **maxNACase**: Maximum number of NA values allowed before a detector’s reading is discarded for samples designated as case.
- **maxNAControl**: Maximum number of NA values allowed before a detector’s reading is discarded for samples designated as control.
- **hkgs**: String containing the name of the name of the housekeeping gene which will be used to normalise the rest of the genes.
- **contrastM**: A binary matrix which designates case and control samples.
- **case**: The name of the column in contrastM that corresponds to the case samples.
- **control**: The name of the column in contrastM that corresponds to the control samples.
- **paired**: Logical - if TRUE the detectors and housekeepers in the same sample will be paired for calculating standard deviation, effectively meaning we will be calculating standard deviation of the differences. If FALSE, there will be no pairing, and standard deviation will be pooled between the detector and housekeepers.
- **hkgCalc**: String - either "arith" or "geom", details how the different housekeeper genes should be combined - either by using the arithmetic or geometric mean.
- **statCalc**: String - either "arith" or "geom", details how genes should be combined - either by using the arithmetic or geometric mean.

Details

Takes expression set of qPCR values and normalises them using different housekeeping genes. Returns separate sets of values for each housekeeping gene given.
Value

matrix with columns containing the detector ids, $2^{\Delta \Delta Cq}$ values for the sample of interest and the calibrator sample, alongside their respective standard deviations, the $2^{\Delta \Delta Cq}$ delta Cq values and the minimum and maximum values (ie the values that are 1 sd away)

rownames(contM) <- sampleNames(qPCRBatch.taqman)

ddCq.taqman <- deltaDeltaCq(qPCRBatch = qPCRBatch.taqman, maxNACase=1, maxNAControl=1, hkg=hkg, contrastM=contM, case="interestingPhenotype", control="wildTypePhenotype", statCalc="geom", hkgCalc="arith")
head(ddCq.taqman)
```

---

**geNorm**

**Data set of Vandesompele et al (2002)**

Description

This data set was used in Vandesompele et al (2002) to demonstrate normalization of real-time quantitative RT-PCR data by geometric averaging of housekeeping genes.
Usage
data(geNorm)

Format
A qPCRBatch object which contains an expression matrix with 85 observations on the following 10 variables which stand for expression data of ten potential reference/housekeeping genes

ACTB actin, beta
B2M beta-2-microglobulin
GAPD glyceraldehyde-3-phosphate dehydrogenase
HMBS hydroxymethylbilane synthase
HPRT1 hypoxanthine phosphoribosyltransferase 1
RPL13A ribosomal protein L13a
SDHA succinate dehydrogenase complex subunit A
TBP TATA box binding protein
UBC ubiquitin C
YWHAZ tyrosine 3-monooxygenase/tryptophan 5-monooxygenase activation protein, zeta polypeptide

Details
The row names of this data set indicate the various human tissues which were investigated.

BM 9 normal bone-marrow samples
POOL 9 normal human tissues from pooled organs (heart, brain, fetal brain, lung, trachea, kidney, mammary gland, small intestine and uterus)
FIB 20 short-term cultured normal fibroblast samples from different individuals
LEU 13 normal leukocyte samples
NB 34 neuroblastoma cell lines (independently prepared in different labs from different patients)

Source
The data set was obtained from http://genomebiology.com/content/supplementary/gb-2002-3-7-research0034-s1.txt

Examples

```r
data(geNorm)
str(exprs(geNorm.qPCRBatch))
sampleNames(geNorm.qPCRBatch)
```

---

### geomMean

**Geometric Mean**

**Description**

Computation of the geometric mean.

**Usage**

```r
geomMean(x, na.rm = TRUE)
```

**Arguments**

- `x` numeric vector of non-negative Reals
- `na.rm` a logical value indicating whether NA values should be stripped before the computation proceeds.

**Details**

The computation of the geometric mean is done via `prod(x)^(1/length(x))`.

**Value**

geometric mean

**Note**

A first version of this function appeared in package SLqPCR.

**Author(s)**

Matthias Kohl <Matthias.Kohl@stamats.de>

**References**

**Examples**

```r
x <- rlnorm(100)
geomMean(x)
```
makeAllNAs

Make all Cq values NA

Description

Make all Cq values for a given detector NA when the number of NAs for that detector is above a given threshold

Usage

makeAllNAs(qPCRBatch, ...)

# S4 method for signature 'qPCRBatch'
makeAllNAs(qPCRBatch, contrastM, sampleMaxM)

Arguments

qPCRBatch  Expression set containing qPCR data.

...  Extra arguments, detailed below

contrastM  Contrast Matrix like that used in limma. Columns represent the different sample types, rows are the different samples, with a 1 or 0 in the matrix indicating which sample types the different samples belong to.

sampleMaxM  Sample Max Matrix. Columns represent the different sample types. There is one value per column, which represents the max number of NAs allowed for that sample type.

Details

Make all NAs when number of NAs above a given threshold

Value

qPCRBatch object with a new exprs slot, everything else equal

Author(s)

James Perkins <jimrperkins@gmail.com>

References

Examples

```r
# read in the data
path <- system.file("exData", package = "NormqPCR")
taqman.example <- file.path(path, "example.txt")
qPCRBatch.taqman <- read.taqman(taqman.example)
exprs(qPCRBatch.taqman)["Ccl20.Rn00570287_m1",] # values before

# make contrastM
a <- c(0,0,1,1,0,0,1,1) # one for each sample type, with 1 representing
b <- c(1,1,0,0,1,1,0,0) # position of sample type in the samplenames vector
contM <- cbind(a,b)
colnames(contM) <- c("case","control") # then give the names of each sample type
rownames(contM) <- sampleNames(qPCRBatch.taqman) # and the rows of the matrix
contM

# make sampleMaxM
sMaxM <- t(as.matrix(c(3,3))) # now make the sample max matrix
colnames(sMaxM) <- c("case","control") # make sure these line up with samples
sMaxM

# function
qPCRBatch.taqman.replaced <- makeAllNAs(qPCRBatch.taqman, contM, sMaxM)
exprs(qPCRBatch.taqman.replaced)["Ccl20.Rn00570287_m1",]
```

---

### makeAllNewVal

**Make all Cq values NA**

**Description**

Make all Cq values for a given detector NA when the number of NAs for that detector is above a given threshold

**Usage**

```r
makeAllNewVal(qPCRBatch, ...)
```

**Arguments**

- `qPCRBatch`: Expression set containing qPCR data.
- `...`: Extra arguments, detailed below.
- `contrastM`: Contrast Matrix like that used in limma. Columns represent the different samples types, rows are the different samples, with a 1 or 0 in the matrix indicating which sample types the different samples belong to.
makeAllNewVal

Sample Max Matrix. Columns represent the different sample types. There is one value per column, which represents the max number of NAs allowed for that sample type.

New value to give the values in the group where the NAs are above the threshold.

Details

Make all a given value when number of NAs above a given threshold, with different thresholds for the different sample classes, using sMaxM and contM to provide this information, as detailed below.

Value

qPCRBatch object with a new exprs slot, everything else equal

Author(s)

James Perkins <jimrperkins@gmail.com>

```
replaceAboveCutOff  

Replace Cq values with new value

Description

Replace Cq values above a given threshold with a new value

Usage

```r
replaceAboveCutOff(qPCRBatch, ...)
```

```r
## S4 method for signature 'qPCRBatch'
replaceAboveCutOff(qPCRBatch, newVal=NA, cutOff=38)
```

Arguments

- `qPCRBatch`: Expression set containing qPCR data.
- `...`: Extra arguments, detailed below
- `newVal`: The new value with which to replace the values above the cutoff
- `cutOff`: the minimal threshold above which the values will be replaced

Details

Replaces values in the exprs slot of the qPCRBatch object that are above a threshold value with a new number

Value

qPCRBatch object with a new exprs slot

Author(s)

James Perkins <jimrperkins@gmail.com>

References

Examples

```r
path <- system.file("exData", package = "NormqPCR")
taqman.example <- file.path(path, "example.txt")
qPCRBatch.taqman <- read.taqman(taqman.example)
exprs(qPCRBatch.taqman)["Ccl20.Rn00570287_m1",]
qPCRBatch.taqman.replaced <- replaceAboveCutOff(qPCRBatch.taqman, newVal = NA, cutOff = 35)
exprs(qPCRBatch.taqman.replaced)["Ccl20.Rn00570287_m1",]
```
replaceNAs

Description
Replace NAs with a given value

Usage
replaceNAs(qPCRBatch, ...)

## S4 method for signature 'qPCRBatch'
replaceNAs(qPCRBatch, newNA)

Arguments
- qPCRBatch: Expression set containing qPCR data.
- ...: Extra arguments, detailed below
- newNA: The new value to replace the NAs with

Details
Replaces NA values in the exprs slot of the qPCRBatch object with a given number

Value
qPCRBatch object with a new exprs slot

Author(s)
James Perkins <jimrperkins@gmail.com>

Examples
```r
path <- system.file("exData", package = "NormqPCR")
taqlman.example <- file.path(path, "example.txt")
qPCRBatch.taqlman <- read.taqlman(taqlman.example)
qPCRBatch.taqlman.replaced <- replaceNAs(qPCRBatch.taqlman, newNA = 40)
exprs(qPCRBatch.taqlman.replaced)["Ccl20.Rn00570287_m1",]
```
selectHKs  

Selection of reference/housekeeping genes

Description

This function can be used to determine a set of reference/housekeeping (HK) genes for gene expression experiments.

Usage

```r
selectHKs(qPCRBatch, ...)  
```

## S4 method for signature 'matrix'
```
selectHKs(qPCRBatch, group, method = "geNorm", minNrHKs = 2, log = TRUE, Symbols, 
          trace = TRUE, na.rm = TRUE)  
```

## S4 method for signature 'qPCRBatch'
```
selectHKs(qPCRBatch, group, method = "geNorm", minNrHKs = 2, log = TRUE, Symbols, 
          trace = TRUE, na.rm = TRUE)  
```

Arguments

- `qPCRBatch`: matrix or qPCRBatch, containing the data (expression matrix) in the exprs slot
- `...`: Extra arguments, detailed below
- `group`: optional factor not used by all methods, hence may be missing
- `method`: method to compute most stable genes
- `minNrHKs`: minimum number of HK genes that should be considered
- `log`: logical: is data on log-scale
- `Symbols`: gene symbols
- `trace`: logical, print additional information
- `na.rm`: a logical value indicating whether NA values should be stripped before the computation proceeds.

Details

This function can be used to determine a set of reference/housekeeping (HK) genes for gene expression experiments. The default method "geNorm" was proposed by Vandesompele et al. (2002). Currently, the geNorm method by Vandesompele et al. (2002) and the NormFinder method of Andersen et al. (2004) are implemented.

Vandesompele et al. (2002) propose a cut-off value of 0.15 for the pairwise variation. Below this value the inclusion of an additional housekeeping gene is not required.
Value

If method = "geNorm" a list with the following components is returned:

- ranking: ranking of genes from best to worst where the two most stable genes cannot be ranked.
- variation: pairwise variation during stepwise selection.
- meanM: average expression stability M.

If method = "NormFinder" a list with the following components is returned:

- ranking: ranking of genes from best to worst where the two most stable genes cannot be ranked.

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

References

Examples

data(geNorm)
tissue <- as.factor(c(rep("BM", 9), rep("FIB", 20), rep("LEU", 13),
                    rep("NB", 34), rep("POOL", 9)))
res.BM <- selectHKs(geNorm.qPCRBatch[, tissue == "BM"], method = "geNorm",
                   Symbols = featureNames(geNorm.qPCRBatch), minNrHK = 2,
                   log = FALSE)
Description

Computation of the gene expression stability value M for real-time quantitativ RT-PCR data. For more details we refer to Vandesompele et al. (2002).

Usage

```r
stabMeasureM(x, log = TRUE, na.rm = TRUE)
```

Arguments

- **x**: matrix or data.frame containing real-time quantitative RT-PCR data
- **log**: logical: is data on log-scale
- **na.rm**: a logical value indicating whether NA values should be stripped before the computation proceeds.

Details

The gene expression stability value M is defined as the average pairwise normalization factor; i.e., one needs to specify data from at least two genes. For more details see Vandesompele et al. (2002). Note this dispatches on a transposed expression matrix, not a qPCRBatch object since it is only called from within the selectHKs method.

Value

numeric vector with gene expression stability values

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

Examples

data(geNorm)
tissue <- as.factor(c(rep("BM", 9), rep("FIB", 20), rep("LEU", 13),
rep("NB", 34), rep("POOL", 9)))
res.BM <- selectHKs(geNorm.qPCRBatch[, tissue == "BM"], method = "geNorm",
Symbols = featureNames(geNorm.qPCRBatch), minNrHK = 2, log = FALSE)

stabMeasureRho gene expression stability value rho

Description

Computation of the gene expression stability value rho for real-time quantitative RT-PCR data. For
more details we refer to Andersen et al. (2004).

Usage

stabMeasureRho(x,...)

## S4 method for signature 'x'
stabMeasureRho(x, group, log = TRUE, na.rm = TRUE, returnAll = FALSE)

Arguments

x matrix containing real-time quantitative RT-PCR data, or qPCRBatch object
...
Extra arguments, detailed below
group grouping factor, either a factor vector or a phenoData column called "Group"
log logical: is data on log-scale
na.rm a logical value indicating whether NA values should be stripped before the com-
putation proceeds.
returnAll logical, return additional information.

Details

The gene expression stability value rho is computed. For more details see Andersen et al. (2004).

Value

numeric vector with gene expression stability values
If returnAll == TRUE a list with the following components is returned

rho stability measure rho of Andersen et al. (2004)
d used by selectHKs
v used by selectHKs
