Package ‘TCGAutils’

March 14, 2024

Title   TCGA utility functions for data management

Version 1.23.4

Description A suite of helper functions for checking and manipulating TCGA
data including data obtained from the curatedTCGAData experiment package.
These functions aim to simplify and make working with TCGA data more
manageable. Exported functions include those that import data from flat files
into Bioconductor objects, convert row annotations, and identifier
translation via the GDC API.

Depends R (>= 4.2.0)

Imports AnnotationDbi, BiocGenerics, BiocBaseUtils, GenomeInfoDb,
GenomicFeatures, GenomicRanges, GenomicDataCommons, IRanges,
methods, MultiAssayExperiment, RaggedExperiment (>= 1.5.7),
rvest, S4Vectors, stats, stringr, SummarizedExperiment, utils,
xml2

Suggests AnnotationHub, BiocStyle, curatedTCGAData, ComplexHeatmap,
devtools, dplyr, httr,
IlluminaHumanMethylation450kanno.ilmn12.hg19, impute, knitr,
magrittr, mirbase.db, org.Hs.eg.db, RColorBrewer, readr,
markdown, RTCGAToolbox (>= 2.17.4), rtracklayer, R.utils,
testthat, TxDb.Hsapiens.UCSC.hg18.knownGene,
TxDb.Hsapiens.UCSC.hg19.knownGene

TCGAutils: Helper functions for working with TCGA and MultiAssay-Experiment data
Description

TCGAutils is a toolbox to work with TCGA specific datasets. It allows the user to manipulate and translate TCGA barcodes, conveniently convert a list of data files to GRangesList. Take datasets from GISTIC and return a SummarizedExperiment class object. The package also provides functions for working with data from the curatedTCGAData experiment data package. It provides convenience functions for extracting subtype metadata data and adding clinical data to existing MultiAssayExperiment objects.

---

builds

Utilities for working with HUMAN genome builds

---

Description

A few functions are available to search for build versions, either from NCBI or UCSC.

- translateBuild: translates between UCSC and NCBI build versions
- extractBuild: use grep patterns to find the first build within the string input
- uniformBuilds: replace build occurrences below a threshold level of occurrence with the alternative build
- correctBuild: Ensure that the build annotation is correct based on the NCBI/UCSC website. If not, use translateBuild with the indicated 'style' input
- isCorrect: Check to see if the build is exactly as annotated
Usage

translateBuild(from, to = c("UCSC", "NCBI"))

correctBuild(build, style = c("UCSC", "NCBI"))

isCorrect(build, style = c("UCSC", "NCBI"))

extractBuild(string, build = c("UCSC", "NCBI"))

uniformBuilds(builds, cutoff = 0.2, na = c("", "NA"))

Arguments

from character() A vector of build versions typically from genome() (e.g., "37"). The build vector must be homogenous (i.e., length(unique(x)) == 1L).

to character(1) The name of the desired build version (either "UCSC" or "NCBI"; default: "UCSC")

build A vector of build version names (default UCSC, NCBI)

style character(1) The annotation style, either 'UCSC' or 'NCBI'

string A single character string

builds A character vector of builds

cutoff numeric(1L) An inclusive threshold tolerance value for missing values and translating builds that are below the threshold

na character() The values to be considered as missing (default: c("", "NA"))

Details

The correctBuild function takes the input and ensures that the style specified matches the input. Otherwise, it will return the correct style for use with seqlevelsStyle. Currently, the function does not support patched builds (e.g., 'GRCh38.p13') Build names are taken from the website: https://www.ncbi.nlm.nih.gov/assembly/GCF_000001405.26/

Value

translateBuild: A character vector of translated genome builds

extractBuild: A character string of the build information available

uniformBuilds: A character vector of builds where all builds are identical `identical(length(unique(build)), 1L)`

correctBuild: A character string of the 'corrected' build name

isCorrect: A logical indicating if the build is exactly as annotated
Examples

```r
translateBuild("GRCh35", "UCSC")

correctBuild("grch38", "NCBI")
correctBuild("hg19", "NCBI")

isCorrect("GRCh38", "NCBI")

isCorrect("hg19", "UCSC")
```

ejectBuild(
  "SCENA_p_TCGAb29and30_SNP_N_GenomeWideSNP_6_G05_569110.nocnv_grch38.seg.txt"
)

buildvec <- rep(c("GRCh37", "hg19"), times = c(5, 1))
uniformBuilds(buildvec)

navec <- c(rep(c("GRCh37", "hg19"), times = c(5, 1)), "NA")
uniformBuilds(navec)

---

**clinicalNames**

*Clinical dataset names in TCGA*

Description

A dataset of names for each of the TCGA cancer codes available. These names were obtained by the clinical datasets from `getFirehoseData`. They serve to subset the current datasets provided by `curatedTCGADatasets`.

Usage

```r
data("clinicalNames")
```

Format

A `CharacterList` of names for 33 cancer codes

Value

The clinical dataset column names in TCGA as provided by the RTCGAToolbox
curatedTCGAData-helpers

*Helper functions for managing MultiAssayExperiment from curatedTCGAData*

**Description**

Additional helper functions for cleaning and uncovering metadata within a downloaded MultiAssayExperiment from curatedTCGAData.

**Usage**

```r
getSubtypeMap(multiassayexperiment)
getClinicalNames(diseaseCode)
TCGAsplitAssays(multiassayexperiment, sampleCodes = NULL, exclusive = FALSE)
sampleTables(multiassayexperiment, vial = FALSE)
```

**Arguments**

- `multiassayexperiment`: A `MultiAssayExperiment` object
- `diseaseCode`: A TCGA cancer code (e.g., “BRCA”)
- `sampleCodes`: character (default NULL) A string of sample type codes (refer to `data(sampleTypes)`, `TCGAsplitAssays` section)
- `exclusive`: logical (default FALSE) Whether to return only assays that contain all codes in `sampleCodes`
- `vial`: (logical default FALSE) whether to display vials in the table output

**Details**

Note that for `getSubtypeMap`, the column of in-data variable names may need to go through `make.names` to be found in the `colData` of the `MultiAssayExperiment`.

**Value**

- `getSubtypeMap`: A `data.frame` with explanatory names and their in-data variable names. They may not be present for all cancer types.
- `getClinicalNames`: A vector of common variable names that may be found across several cancer disease codes.

**getSubtypeMap**

provides a two column data.frame with interpreted names and in-data variable names. ‘Name’ usually refers to the `colData` row names a.k.a. the `patientID`. 
getClinicalNames

provides a vector of common variable names that exist in the colData DataFrame of a curatedTCGAData MultiAssayExperiment object. These variables are directly obtained from the BroadFirehose clinical data (downloaded with getFirehoseData) and tend to be present across cancer disease codes.

TCGAsplitAssays

Separates samples by indicated sample codes into different assays in a MultiAssayExperiment. Refer to the sampleTypes data object for a list of available codes. This operation generates n times the number of assays based on the number of sample codes entered. By default, all assays will be split by samples present in the data.

sampleTables

Display all the available samples in each of the assays

Examples

library(curatedTCGAData)

gbm <- curatedTCGAData("GBM", c("RPPA*", "CNA*"), version = "2.0.1", FALSE)

getSubtypeMap(gbm)
sampleTables(gbm)

TCGAsplitAssays(gbm, c("01", "10"))

getClinicalNames("COAD")

---

diseaseCodes  TCGA Cancer Disease Codes Table

Description

A dataset for obtaining the cancer codes in TCGA for about 13 different types of cancers.

Usage

data("diseaseCodes")

Format

A data frame with 37 rows and 2 variables:

- **Study.Abbreviation**  Disease Code used in TCGA
- **Available**  Cancer datasets available via curatedTCGAData
- **SubtypeData**  Subtype curation data available via curatedTCGAData
- **Study.Name**  The full length study name (i.e., type of cancer)
findGRangesCols

The TCGA diseaseCodes table

Source

https://gdc.cancer.gov/resources-tcga-users/tcga-code-tables/tcga-study-abbreviations

findGRangesCols Obtain minimum necessary names for the creation of a GRangesList object

Description

This function attempts to match chromosome, start position, end position and strand names in the given character vector. Modified helper from the GenomicRanges package.

Usage

findGRangesCols(
  df_colnames,
  seqnames.field = c("seqnames", "seqname", "chromosome", "chrom", "chr",
                      "chromosome_name", "seqid", "om"),
  start.field = "start",
  end.field = c("end", "stop"),
  strand.field = "strand",
  ignore.strand = FALSE
)

Arguments

  df_colnames  A character vector of names in a dataset
  seqnames.field  A character vector of the chromosome name
  start.field  A character vector that indicates the column name of the start positions of ranged data
  end.field  A character vector that indicates the end position of ranged data
  strand.field  A character vector of the column name that indicates the strand type
  ignore.strand  logical (default FALSE) whether to ignore the strand field in the data

Value

Index positions vector indicating columns with appropriate names

Examples

myDataColNames <- c("Start_position", "End_position", "strand",
                     "chromosome", "num_probes", "segment_mean")
findGRangesCols(myDataColNames)
generateMap  

Create a sampleMap from an experiment list and phenoData dataframe

Description

This function helps create a sampleMap in preparation of a MultiAssayExperiment object. This especially useful when the sample identifiers are not very different, as in the case of TCGA barcodes. An idConverter function can be provided to truncate such sample identifiers and obtain patient identifiers.

Usage

```r
generateMap(
  experiments,  
  colData,  
  idConverter = identity,  
  sampleCol,  
  patientCol,  
  ...
)
```

Arguments

- `experiments`: A named list of experiments compatible with the MultiAssayExperiment API
- `colData`: A `data.frame` of clinical data with patient identifiers as rownames
- `idConverter`: A function to be used against the sample or specimen identifiers to match those in the rownames of the `colData` (default NULL)
- `sampleCol`: A single string indicating the sample identifiers column in the `colData` dataset
- `patientCol`: A single string indicating the patient identifiers in `colData`, "row.names" extracts the `colData` row names
- `...`: Additional arguments to pass to the 'idConverter' function.

Value

A `DataFrame` class object of mapped samples and patient identifiers including assays

Author(s)

M. Ramos, M. Morgan, L. Schiffer
Examples

```r
## Minimal example
expList <- list(assay1 = matrix(1:6, ncol = 2L,
    dimnames = list(paste0("feature", 1:3), c("A-J", "B-J"))),
    assay2 = matrix(1:4, ncol = 2,
    dimnames = list(paste0("gene", 1:2), c("A-L", "B-L"))))

## Mock colData
myPheno <- data.frame(var1 = c("Yes", "No"), var2 = c("High", "Low"),
    row.names = c("a", "b"))

## A look at the identifiers
vapply(expList, colnames, character(2L))
rownames(myPheno)

## Use 'idConverter' to correspond sample names to patient identifiers
generateMap(expList, myPheno,
    idConverter = function(x) substr(tolower(x), 1L, 1L))
```

---

**getFileName**

*Find the file names used in RTCGAToolbox*

Description

Part of this function is from the RTCGAToolbox. It aims to extract the file name used inside of the `getFirehoseData` function. The arguments of the function parallel those in the `getFirehoseData` function. It is only available for select data types.

Usage

```r
getFileName(
    disease,
    runDate = "20160128",
    dataType = c("CNASNP", "CNVSNP", "CNAseq", "CNACGH", "Mutation")
)
```

Arguments

- **disease** The TCGA cancer disease code, e.g., "COAD"
- **runDate** The single string used in the `getFirehoseData` function (default "20160128")
- **dataType** A single character vector (default "CNASNP") indicating the data type for which to get the source file name

Value

A single character file name
Examples

得到文件名("COAD", dataType = "CNASNP")

Description

A small document for helper functions

Usage

- .makeListRanges(x, gn)
- .getRangesOfSYMBOLS(x)
- .getRangesOfMir(x)

Arguments

- x: A SummarizedExperiment containing hsa miR IDs as rownames
- gn: A GRanges object with some of its names found in x

Value

A list of length 2: unmapped (character vector) and mapped (GRanges)
list of length 2: "unmapped" is a character vector providing unmapped symbols, "mapped" is a
GRanges object with ranges of mapped symbols

ID-translation

Translate study identifiers from barcode to UUID and vice versa

Description

These functions allow the user to enter a character vector of identifiers and use the GDC API to
translate from TCGA barcodes to Universally Unique Identifiers (UUID) and vice versa. These
relationships are not one-to-one. Therefore, a data.frame is returned for all inputs. The UUID
to TCGA barcode translation only applies to file and case UUIDs. Two-way UUID translation is
available from 'file_id' to 'case_id' and vice versa. Please double check any results before using
these features for analysis. Case / submitter identifiers are translated by default, see the from_type
argument for details. All identifiers are converted to lower case.
Usage

UUIDtoBarcode(id_vector, from_type = c("case_id", "file_id", "aliquot_ids"))

UUIDtoUUID(id_vector, to_type = c("case_id", "file_id"))

barcodeToUUID(barcodes)

filenameToBarcode(filenames, slides = FALSE)

UUIDhistory(id, endpoint = .HISTORY_ENDPOINT)

Arguments

id_vector character() A vector of UUIDs corresponding to either files or cases (default assumes case_ids)
from_type character(1) Either case_id or file_id indicating the type of id_vector entered (default "case_id")
to_type character(1) The desired UUID type to obtain, can either be "case_id" (default) or "file_id"
barcodes character() A vector of TCGA barcodes
filenames character() A vector of file names usually obtained from a GenomicDataCommons query
slides logical(1L) Whether the provided file names correspond to slides typically with an .svs extension. Note The barcodes returned correspond 1:1 with the filename inputs. Always triple check the output against the Genomic Data Commons Data Portal by searching the file name and comparing associated "Entity ID" with the submitter_id given by the function.
id character(1) A UUID whose history of versions is sought
endpoint character(1) Generally a constant pertaining to the location of the history api endpoint. This argument rarely needs to change.

Details

Based on the file UUID supplied, the appropriate entity_id (TCGA barcode) is returned. In previous versions of the package, the 'end_point' parameter would require the user to specify what type of barcode needed. This is no longer supported as entity_id returns the appropriate one.

Value

Generally, a data.frame of identifier mappings

UUIDhistory: A data.frame containing a list of associated UUIDs for the given input along with file_change status, data_release versions, etc.

Author(s)

Sean Davis, M. Ramos
Examples

```r
## Translate UUIDs >> TCGA Barcode

uuids <- c("b4bce3ff-7fdc-4849-880b-56f2b348ceac",
"5ca9fa79-53bc-4e91-82cd-5715038ee23e",
"b7c3e5ad-4ffc-4fc4-acbf-1dfcbd2e5382")

UUIDtoBarcode(uuids, from_type = "file_id")

UUIDtoBarcode("ae55b2d3-62a1-419e-9f9a-5ddfac356db4", from_type = "case_id")

UUIDtoBarcode("d85d8a17-8aea-49d3-8a03-8f13141c163b", "aliquot_ids")

## Translate file UUIDs >> case UUIDs

uuids <- c("b4bce3ff-7fdc-4849-880b-56f2b348ceac",
"5ca9fa79-53bc-4e91-82cd-5715038ee23e",
"b7c3e5ad-4ffc-4fc4-acbf-1dfcbd2e5382")

UUIDtoUUID(uuids)

## Translate TCGA Barcode >> UUIDs

fullBarcodes <- c("TCGA-B0-5117-11A-01D-1421-08",
"TCGA-B0-5094-11A-01D-1421-08",
"TCGA-E9-A295-10A-01D-A16D-09")

sample_ids <- TCGAbarcode(fullBarcodes, sample = TRUE)

barcodeToUUID(sample_ids)

participant_ids <- c("TCGA-CK-4948", "TCGA-D1-A17N",
"TCGA-4V-A9QX", "TCGA-4V-A9QM")

barcodeToUUID(participant_ids)

library(GenomicDataCommons)

### Query CNV data and get file names

cnv <- files() |> filter(~ cases.project.project_id == "TCGA-COAD" &
data_category == "Copy Number Variation" &
data_type == "Copy Number Segment") |> results(size = 6)

filenameToBarcode(cnv$file_name)

### Query slides data and get file names

```
imputeAssay <- function(multiassayexperiment, i = 1, ...) {
  A MultiAssayExperiment with genes in the rows, samples in the columns
}

Usage
imputeAssay(multiassayexperiment, i = 1, ...)

Arguments
multiassayexperiment
  A MultiAssayExperiment with genes in the rows, samples in the columns
i
  A numeric, logical, or character vector indicating the assays to perform imputation on (default 1L)

... Arguments passed on to impute::impute.knn
data
  An expression matrix with genes in the rows, samples in the columns
k
  Number of neighbors to be used in the imputation (default=10)
rowmax
  The maximum percent missing data allowed in any row (default 50%). For any rows with more than rowmax% missing are imputed using the overall mean per sample.
colmax
  The maximum percent missing data allowed in any column (default 80%). If any column has more than colmax% missing data, the program halts and reports an error.
maxp
  The largest block of genes imputed using the knn algorithm inside impute.knn (default 1500); larger blocks are divided by two-means clustering (recursively) prior to imputation. If maxp=p, only knn imputation is done.
rng.seed
  The seed used for the random number generator (default 362436069) for reproducibility.
**Description**

`makeGRangesListFromCopyNumber` allows the user to convert objects of class `data.frame` or `S4Vectors::DataFrame` to a `GRangesList`. It includes additional features specific to TCGA data such as, hugo symbols, probe numbers, segment means, and ucsc build (if available).

**Usage**

```r
makeGRangesListFromCopyNumber(
  df,
  split.field,
  names.field = "Hugo_Symbol",
  ...
)
```

**Arguments**

- `df` A `data.frame` or `DataFrame` class object. list class objects are coerced to `data.frame` or `DataFrame`.
- `split.field` A character vector of length one indicating the column to be used as sample identifiers.
- `names.field` A character vector of length one indicating the column to be used as names for each of the ranges in the data.
- `...` Additional arguments to pass on to `makeGRangesListFromDataFrame`.

**Value**

A `GRangesList` class object.
Examples

```r
library(GenomicDataCommons)

manifest <- files() |> 
  filter(~ cases.project.project_id == "TCGA-COAD" &
         data_type == "Copy Number Segment") |> 
  manifest(size = 1)

fname <- gdcdata(manifest$id)

barcode <- UUIDtoBarcode(names(fname), from_type = "file_id")
barcode <- barcode[["associated_entities.entity_submitter_id"]]

cndata <- read.delim(fname[[1L]], nrows = 10L)

cngrl <- makeGRangesListFromCopyNumber(cndata, split.field = "GDC_Aliquot",
                                        keep.extra.columns = TRUE)

names(cngrl) <- barcode
GenomeInfoDb::genome(cngrl) <- extractBuild(fname[[1L]])
cngrl
```

Description

This function serves to read exon-level expression data. It works for exon quantification (raw counts and RPKM) and junction quantification (raw counts) file paths and represents such data as a GRangesList. The data files can be downloaded via the Genomic Data Commons (GDC) Legacy Archive.

Usage

```r
makeGRangesListFromExonFiles(
  filepaths,
  sampleNames = NULL,
  fileNames = basename(filepaths),
  getBarcodes = TRUE,
  rangesColumn = "exon",
  nrows = Inf
)
```

Arguments

- `filepaths`: character() vector of file paths containing TCGA exon data usually obtained from the GDC.
mergeColData

sampleNames  character() vector of TCGA barcodes to be used as names for the GRangesList output (default NULL)

fileNames  character() vector of file names as downloaded from the Genomic Data Commons Legacy archive (default basename(filepaths))

getBarcodes  logical(1). Whether to query the GDC API with the filenameToBarcode and obtain the TCGA barcodes from the file names (default TRUE); see details.

rangesColumn  character(1). The name of the column in the data containing the ranges information (default "exon"); see details.

nrows  numeric(1). The number of rows to return from each of the files read in (all rows by default; default Inf)

Details

The rangesColumn name in the GDC data files is usually "exon" but can be changed with the rangesColumn argument, if different. To avoid programmatically obtaining TCGA barcodes from the GDC API, set the getBarcodes to FALSE. When getBarcodes is set to FALSE, the file names are used to name the elements of the GRangesList output.

Value

A GRangesList object

Author(s)

M. Ramos

Examples

```r
## Load example file found in package
pkgDir <- system.file("extdata", package = "TCGAutils", mustWork = TRUE)
exonFile <- list.files(pkgDir, pattern = "cation\.txt\$", full.names = TRUE)

filePrefix <- "unc.edu.32741f9a-9fec-441f-96b4-e504e62c5362.1755371."

## Add actual file name manually (due to Windows OS restriction)
makeGRangesListFromExonFiles(exonFile,
   fileNames = paste0(filePrefix, basename(exonFile)),
   sampleNames = "TCGA-AA-3678-01A-01R-0905-07")
```

mergeColData  Take a MultiAssayExperiment and include curated variables
Description

This function works on the colData of a MultiAssayExperiment object to merge curated variable columns or other clinical variables that would like to be added. It is recommended that the user run the scripts in the MultiAssayExperiment.TCGA repository that build the "enhanced" type of data but not necessary if using different clinical data. Please see the repository's README for more information.

Usage

mergeColData(MultiAssayExperiment, colData)

Arguments

MultiAssayExperiment
A MultiAssayExperiment object

colData
A DataFrame or data.frame to merge with clinical data in the MultiAssayExperiment object

Value

A MultiAssayExperiment object

Examples

library(MultiAssayExperiment)

mergeColData(MultiAssayExperiment(), S4Vectors::DataFrame())

---

oncoPrintTCGA

OncoPrint for TCGA Mutation Assays

Description

OncoPrint for TCGA Mutation Assays

Usage

oncoPrintTCGA(
    multiassayexperiment,
    matchassay = "*_Mutation-*",
    variantCol = "Variant_Classification",
    brewerPal = "Set3",
    ntop = 25,
    incl.thresh = 0.01,
    rowcol = "Hugo_Symbol"
)
Arguments

multiassayexperiment
  A MultiAssayExperiment, usually from curatedTCGAData
matchassay
  character(1) The name of the assay containing mutation data, this can be a pattern (e.g., ".Mutation-", the default)
variantCol
  character(1) The name of the metadata column containing the mutation categories, usually "Variant_Classification" in TCGA
brewerPal
  character(1) The name of the RColorBrewer::brewer.pal palette, (default: "Set3")
ntop
  integer(1) The number of the top N genes for displaying based on per-sample mutation frequency
incl.thresh
  double(1) The inclusion threshold for empirical mutations, mutations less frequent than this value will not be included
rowcol
  character(1) The name of the column in the metadata to annotate the rows with either "Hugo_Symbol" (default) or

Value

An oncoPrint plot of mutations

Examples

library(curatedTCGAData)

  acc <- curatedTCGAData("ACC", "Mutation", version = "1.1.38", FALSE)
  oncoPrintTCGA(acc)

---

sampleTypes

Barcode Sample Type Table

Description

A dataset that contains the mappings for sample codes in the TCGA barcodes.

Usage

data("sampleTypes")

Format

A data frame with 19 rows and 3 variables:

  Code  Two digit code number found in the barcode
  Definition  Long name for the sample type
  Short.Letter.Code  Letter code for the sample type
**simplifyTCGA**

Functions to convert rows annotations to ranges and **RaggedExperiment** to **RangedSummarizedExperiment**

**Description**

This group of functions will convert row annotations as either gene symbols or miRNA symbols to row ranges based on database resources `TxDB` and `org.Hs` packages. It will also simplify the representation of **RaggedExperiment** objects to **RangedSummarizedExperiment**.

**Usage**

- `simplifyTCGA(obj, keep.assay = FALSE, unmapped = TRUE)`
- `symbolsToRanges(obj, keep.assay = FALSE, unmapped = TRUE)`
- `mirToRanges(obj, keep.assay = FALSE, unmapped = TRUE)`
- `CpGtoRanges(obj, keep.assay = FALSE, unmapped = TRUE)`
- `qreduceTCGA(obj, keep.assay = FALSE, suffix = "_simplified")`

**Arguments**

- **obj**: A `MultiAssayExperiment` object obtained from `curatedTCGAData`
- **keep.assay**: logical (default FALSE) Whether to keep the `SummarizedExperiment` assays that have been converted to `RangedSummarizedExperiment`
- **unmapped**: logical (default TRUE) Include an assay of data that was not able to be mapped in reference database
- **suffix**: character (default ":_simplified") A character string to append to the newly modified assay for `qreduceTCGA`.

**Details**

The original `SummarizedExperiment` containing either gene symbol or miR annotations is replaced or supplemented by a `RangedSummarizedExperiment` for those that could be mapped to `GRanges`, and optionally another `SummarizedExperiment` for annotations that could not be mapped to `GRanges`.

**Value**

The TCGA sampleTypes table

**Source**

https://gdc.cancer.gov/resources-tcga-users/tcga-code-tables/sample-type-codes
Value

A `MultiAssayExperiment` with any gene expression, miRNA, copy number, and mutations converted to `RangedSummarizedExperiment` objects

qreduceTCGA

Using `TxDb.Hsapiens.UCSC.hg19.knownGene` as the reference, `qreduceTCGA` reduces the data by applying either the `weightedmean` or `nonsilent` function (see below) to non-mutation or mutation data, respectively. Internally, it uses `RaggedExperiment::qreduceAssay()` to reduce the ranges to the gene-level.

`qreduceTCGA` will update `genome(x)` based on the NCBI reference annotation which includes the patch number, e.g., GRCh37.p14, as provided by the `seqlevelsStyle` setter, `seqlevelsStyle(gn) <- "NCBI"`. `qreduceTCGA` uses the NCBI genome annotation as the default reference.

\[
\text{nonsilent} \leftarrow \text{function}(\text{scores, ranges, qranges}) \\
\quad \text{any(}\text{scores} \neq \"\text{Silent}\") \\
\]

RaggedExperiment mutation objects become a genes by patients `RangedSummarizedExperiment` object containing '1' if there is a non-silent mutation somewhere in the gene, and '0' otherwise as obtained from the `Variant_Classification` column in the data.

\[
\text{weightedmean} \leftarrow \text{function}(\text{scores, ranges, qranges}) \\
\quad \text{isects} \leftarrow \text{GenomicRanges::pintersect}(\text{ranges, qranges}) \\
\quad \text{sum(}\text{scores} \times \text{BiocGenerics::width(isects)}) / \\
\quad \text{sum(}\text{BiocGenerics::width(isects)}) \\
\]

"CNA" and "CNV" segmented copy number are reduced using a weighted mean in the rare cases of overlapping (non-disjoint) copy number regions.

These functions rely on `TxDb.Hsapiens.UCSC.hg19.knownGene` and `org.Hs.eg.db` to map to the 'hg19' NCBI build. Use the `liftOver` procedure for datasets that are provided against a different reference genome (usually 'hg18'). See an example in the vignette.

Author(s)

L. Waldron

Examples

```r
library(curatedTCGAData)
library(GenomeInfoDb)

accmae <-
  curatedTCGAData(diseaseCode = "ACC",
  assays = c("CNASNP", "Mutation", "miRNASeqGene", "GISTICT"),
  version = "1.1.38",
  dry.run = FALSE)
```
## update genome annotation
rex <- accmae["ACC_Mutation-20160128"]

## Translate build to "hg19"
tgenome <- vapply(genome(rex), translateBuild, character(1L))
genome(rex) <- tgenome

accmae["ACC_Mutation-20160128"] <- rex
simplifyTCGA(accmae)

---

**TCGAbarcode**  
*Parse data from TCGA barcode*

### Description
This function returns the specified snippet of information obtained from the TCGA barcode.

### Usage

```r
TCGAbarcode(
  barcodes,
  participant = TRUE,
  sample = FALSE,
  portion = FALSE,
  plate = FALSE,
  center = FALSE,
  index = NULL
)
```

### Arguments

- **barcodes**: A character vector of TCGA barcodes
- **participant**: Logical (default TRUE) participant identifier chunk
- **sample**: Logical (default FALSE) includes the numeric sample code of the barcode and the vial letter
- **portion**: Logical (default FALSE) includes the portion and analyte codes of the barcode
- **plate**: Logical (default FALSE) returns the plate value
- **center**: Logical (default FALSE) returns a matrix with the plate and center codes
- **index**: An optional numeric vector indicating barcode positions when split by the delimiter (i.e., hyphen '-')
  For example, an index of `c(1, 2)` corresponds to 'TCGA-ZZ' in TCGA-ZZ-A1A1.

### Value
A character vector or data matrix of TCGA barcode information
Author(s)

M. Ramos

Examples

```r
barcodes <- c("TCGA-B0-5117-11A-01D-1421-08",
  "TCGA-B0-5994-11A-01D-1421-08",
  "TCGA-E9-A295-10A-01D-A16D-09")

## Patient identifiers
TCGAbarcodes(barcodes)

## Sample identifiers
TCGAbarcodes(barcodes, sample = TRUE)
```

---

**Description**

This function uses the full TCGA barcode to return a data frame of the data pertinent to laboratory variables such as vials, portions, analytes, plates and the center.

**Usage**

```r
TCGAbiospec(barcodes)
```

**Arguments**

- `barcodes` A character vector of TCGA barcodes

**Value**

A dataframe with sample type, sample code, portion, plate, and center columns.

**Author(s)**

M. Ramos

**Examples**

```r
example("TCGAbarcodes")
TCGAbiospec(barcodes)
```
### TCGAprimaryTumors

#### Select primary tumors from TCGA datasets

**Description**

Tumor selection is decided using the `sampleTypes` data. For 'LAML' datasets, the primary tumor code used is "03" otherwise, "01" is used.

**Usage**

```r
TCGAprimaryTumors(multiassayexperiment)
```

**Arguments**

- `multiassayexperiment`
  
  A `MultiAssayExperiment` with TCGA data as obtained from `curatedTCGAData::curatedTCGAData()`

**Value**

A `MultiAssayExperiment` containing only primary tumor samples

**Examples**

```r
example(getSubtypeMap)
TCGAprimaryTumors(gbm)
```

### TCGAsampleSelect

#### Select samples from barcodes from lookup table

**Description**

The TCGA barcode contains several pieces of information which can be parsed by the `TCGAbocode` function. To select a specific type of sample, enter the appropriate `sampleCode` argument from the lookup table. See lookup table in `data("sampleTypes")`. Barcode inputs can be a character vector or a `CharacterList` object.

**Usage**

```r
TCGAsampleSelect(barcodes, sampleCodes)
```

**Arguments**

- `barcodes`
  
  Either a TCGA barcode vector or `CharacterList` containing patient identifiers, sample, portion, plate, and center codes.

- `sampleCodes`
  
  Either a character or numeric vector of TCGA sample codes. See the `sampleType` dataset.
trimColData

Value
A logical vector or LogicalList of the same length as 'barcodes' indicating sample type matches

Examples

example("TCGAbarcodes")
TCGAsampleSelect(barcodes, c(11, 01))

trimColData  
Minimize the number of variables in colData

Description
This function removes variables that have a high number of missing data and contain keywords.

Usage

trimColData(
    multiassayexperiment,
    maxNAfrac = 0.2,
    keystring = c("portion", "analyte")
)

Arguments

multiassayexperiment
A MultiAssayExperiment object with colData

maxNAfrac  (numeric default 0.2) A decimal between 0 and 1 to indicate the amount of NA values allowed per column

keystring  (character) A vector of keywords to match and remove variables

Value
A MultiAssayExperiment object

Examples

example(getSubtypeMap)

(gbm_trimmed <- trimColData(gbm))

head(colData(gbm_trimmed))[1:5]
