Package ‘hoodscanR’

March 6, 2024

Title  Spatial cellular neighbourhood scanning in R
Version  1.1.1
Description  hoodscanR is an user-friendly R package providing functions to assist
  cellular neighborhood analysis of any spatial transcriptomics data with single-cell resolution.
  All functions in the package are built based on the SpatialExperiment object,
  allowing integration into various spatial transcriptomics-related packages from Bioconductor.
  The package can result in cell-level neighborhood annotation output, along with functions to
  perform neighborhood colocalization analysis and neighborhood-based cell clustering.

1
Description

hoodscanR implements a novel method to scan for cell neighbourhood from spatial transcriptomics data at single cell level, such as CosMx and MERFISH etc. hoodscanR takes the cellular position and cell type annotations as inputs, allowing cellular spatial neighbourhood analysis.

Details

Key neighborhood analysis functions include `findNearCells`, `scanHoods`, `mergeByGroup`, `calcMetrics`, `clustByHood`.

Key visualisation functions include `plotTissue`, `plotHoodMat`, `plotColocal`, `plotProbDist`.

calcMetrics

Calculate metrics for probability matrix

Description
Calculate metrics for probability matrix

Usage
calcMetrics(spe, pm = NA, pm_cols = NA, val_names = c("entropy", "perplexity"))

Arguments
- **spe**: A SpatialExperiment object.
- **pm**: Optional. The probability matrix.
- **pm_cols**: The colnames of probability matrix. This is requires for SpatialExperiment input. Assuming that the probability is stored in the colData.
- **val_names**: Character vector with length of 2. Column names used to store calculated entropy and perplexity.

Value
A SpatialExperiment object. Calculated entropy and perplexity are saved as columns in the colData of the SpatialExperiment object. Entropy and perplexity are calculated based on information theory:
- Entropy \( H(x) = -P(x) \log_2(P(x)) \)
- Perplexity \( P(x) = 2^{H(x)} \)

By default, the calculated entropy and perplexity will be stored in the colData of the input spe, with column name as entropy and perplexity.

Examples
```r
data("spe_test")
spe <- readHoodData(spe, anno_col = "celltypes")
fnc <- findNearCells(spe, k = 100)
pm <- scanHoods(fnc$distance)
pm2 <- mergeByGroup(pm, fnc$cells)
spe <- mergeHoodSpe(spe, pm2)
spe <- calcMetrics(spe, pm_cols = colnames(pm2))
```
**clustByHood**

*Cluster the probability matrix with K-means*

**Description**

Cluster the probability matrix with K-means

**Usage**

```r
clustByHood(object, ...)  
```

```r
## S4 method for signature 'matrix'
clustByHood(object, k = 2^ncol(object) - 1, iter_max = 1000, nstart = 5)
```

```r
## S4 method for signature 'SpatialExperiment'
clustByHood(
  object,
  pm_cols,
  k = 0,
  iter_max = 1000,
  nstart = 5,
  algo = "Hartigan-Wong",
  val_names = "clusters"
)
```

**Arguments**

- **object**: A probability matrix or a SpatialExperiment.
- **...**: Ignore parameter.
- **k**: The number of clusters. By default is \(2^{\text{ncol}(\text{object})} - 1\).
- **iter_max**: the maximum number of iterations allowed.
- **nstart**: how many random sets should be chosen.
- **pm_cols**: The colnames of probability matrix. This is requires for SpatialExperiment input. Assuming that the probability is stored in the colData.
- **algo**: Algorithm to be used. Options include Hartigan-Wong, Lloyd, and MacQueen.
- **val_names**: Character. Column names used to store the clusters.

**Value**

A probability matrix or a SpatialExperiment object. For latter, the clustering results are saved in the colData of the SpatialExperiment object.
findNearCells

Examples

m <- matrix(abs(rnorm(1000 * 100)), 1000, 100)
clust <- clustByHood(m, k = 3)

findNearCells Find the k-th nearest cells for each cell

Description

Find the k-th nearest cells for each cell

Usage

findNearCells(
  dat,
  k = 100,
  targetCell = FALSE,
  reportCellID = FALSE,
  reportDist = TRUE,
  anno_col = 0
)

Arguments

dat A SpatialExperiment object, can be generated using function readHoodData.
k The maximum number of nearest cells to compute.
targetCell Specify the cells to be the target cell for finding nearest cells.
reportCellID Logical. Set to TRUE to report cell id instead of cell types.
reportDist Logical. Set to TRUE to report the distance matrix.
anno_col Character vector. The name of annotation column to use.

Details

The findNearCells function uses the nn2 function from the RANN package, which uses the Approximate Near Neighbor (ANN) C++ library. For more information on the ANN library please see http://www.cs.umd.edu/~mount/ANN/.

Value

A list includes a data.frame and a matrix, describing the cell types and distances of the k-th nearest cells of each cell.
Examples

```r
data("spe_test")
spe <- readHoodData(spe, anno_col = "celltypes")

fnc <- findNearCells(spe, k = 100)
```

mergeByGroup

Merge probability matrix based on annotations

Description

Merge probability matrix based on annotations

Usage

```r
mergeByGroup(pm, group_df)
```

Arguments

- `pm`: A numeric matrix. Probability matrix generated by the soft_max function.
- `group_df`: A character matrix. Annotation of the neighboring cells to be used.

Value

A probability matrix, describing the probability of each cell being in each cellular neighborhood.

Examples

```r
data("spe_test")
spe <- readHoodData(spe, anno_col = "celltypes")

fnc <- findNearCells(spe, k = 100)

pm <- scanHoods(fnc$distance)

pm2 <- mergeByGroup(pm, fnc$cells)
```
mergeHoodSpe

Merge probability matrix into SpatialExperiment object.

Description

Merge probability matrix into SpatialExperiment object.

Usage

mergeHoodSpe(spe, pm, val_names = NULL)

Arguments

spe
  A SpatialExperiment object.

pm
  Probability matrix. Can be obtained by the function mergeByGroup.

val_names
  Character vector with length of the ncol of pm.

Value

A SpatialExperiment object. Cell-level neighborhood information are saved in the colData of the SpatialExperiment object.

Examples

data("spe_test")
spe <- readHoodData(spe, anno_col = "celltypes")
fnc <- findNearCells(spe, k = 100)

pm <- scanHoods(fnc$distance)

pm2 <- mergeByGroup(pm, fnc$cells)
spe <- mergeHoodSpe(spe, pm2)

plotColocal

Plot heatmap for neighbourhood analysis

Description

Plot heatmap for neighbourhood analysis
Usage

plotColocal(object, ...)

## S4 method for signature 'matrix'
plotColocal(object, hm_width = 5, hm_height = 5)

## S4 method for signature 'SpatialExperiment'
plotColocal(
  object,
  pm_cols,
  self_cor = TRUE,
  by_group = NULL,
  hm_width = 5,
  hm_height = 5,
  cluster_row = TRUE,
  cluster_col = TRUE,
  return_matrix = FALSE
)

Arguments

object       A probability matrix or SpatialExperiment.
...          Ignore parameter.
hm_width     Integer. The width of heatmap.
hm_height    Integer. The height of heatmap.
pm_cols      The colnames of probability matrix. This is requires for SpatialExperiment in-
              put. Assuming that the probability is stored in the colData.
self_cor     Logical. By default is TRUE, indicating running a correlation between neigh-
              bourhoods to perform a simple co-localization analysis. When this set to FALSE,
              it will plot the average probability of each neighbourhood by group using the
              by_group parameter.
by_group     Character. This is required when self_cor is set to FALSE.
cluster_row  Logical. Cluster rows.
cluster_col  Logical. Cluster columns.
return_matrix Logical. Export a numeric matrix.

Value

A ComplexHeatmap plot. When return_matrix is set to TRUE, return a matrix Object.

Examples

data("spe_test")

spe <- readHoodData(spe, anno_col = "celltypes")
```r
fnc <- findNearCells(spe, k = 100)
pm <- scanHoods(fnc$distance)
pm2 <- mergeByGroup(pm, fnc$cells)
spe <- mergeHoodSpe(spe, pm2)
plotColocal(spe, pm_cols = colnames(pm2))
plotColocal(spe, pm_cols = colnames(pm2), self_cor = FALSE, by_group = "cell_annotation")
```

**plotHoodMat**  
Plot probability matrix as a heatmap

**Description**
Plot probability matrix as a heatmap

**Usage**
```r
plotHoodMat(object, ...)
```

## S4 method for signature 'matrix'
```r
plotHoodMat(
  object,
  targetCells = NA,
  n = 30,
  hm_width = 4,
  hm_height = 15,
  clusterRows = TRUE,
  clusterCols = TRUE,
  title = "Probability of neighborhoods"
)
```

## S4 method for signature 'SpatialExperiment'
```r
plotHoodMat(
  object,
  pm_cols,
  targetCells = NA,
  n = 30,
  hm_width = 4,
  hm_height = 15,
  clusterRows = TRUE,
  clusterCols = TRUE,
  title = "Probability of neighborhoods"
)
```
Arguments

object: A probability matrix or SpatialExperiment.

...: Ignore parameter.

targetCells: Character. Optional. Can specify one or more cells to be plotted.
n: Integer. The number of randomly selected cells to be plotted. This parameter will be used when targetCells is not specify.

hm_width: Integer. The width of heatmap.

hm_height: Integer. The height of heatmap.

clusterRows: Logical. Cluster rows or not.

clusterCols: Logical. Cluster columns or not.

title: Title of the heatmap.

pm_cols: The colnames of probability matrix. This is requires for SpatialExperiment input. Assuming that the probability is stored in the colData.

Value

A ComplexHeatmap plot.

Examples

data("spe_test")

spe <- readHoodData(spe, anno_col = "celltypes")

fnc <- findNearCells(spe, k = 100)

pm <- scanHoods(fnc$distance)

pm2 <- mergeByGroup(pm, fnc$cells)

spe <- mergeHoodSpe(spe, pm2)

plotHoodMat(spe, pm_cols = colnames(pm2))

plotProbDist

Plot probability distribution

Description

Plot probability distribution
Usage

plotProbDist(object, ...)  
## S4 method for signature 'matrix'
plotProbDist(object, targetCells = NA, ...)

## S4 method for signature 'SpatialExperiment'
plotProbDist(
  object,
  pm_cols,
  targetCells = NA,
  by_cluster = FALSE,
  show_clusters = as.character(seq(6)),
  plot_all = FALSE,
  sample_size = 2,
  ...
)

Arguments

object A probability matrix or SpatialExperiment.
...
aesthetic mappings to pass to ggplot2::aes_string().
targetCells Character. Optional. Can specify one or more cells to be plotted.
pm_cols The colnames of probability matrix. This is requires for SpatialExperiment input. Assuming that the probability is stored in the colData.
by_cluster Logical. By default is TRUE, to plot distribution by each cluster.
show_clusters Character. The cluster to be plotted, by default is 1 to 6.
plot_all Logical. By default is FALSE, set this to true to plot box plot instead of bar plot to show all cells in each cluster.
sample_size Integer. By default is 2, sampling two cell from each cluster to be plotted.

Value

A ggplot object.

Examples

```
data("spe_test")
spe <- readHoodData(spe, anno_col = "celltypes")
fnc <- findNearCells(spe, k = 100)

pm <- scanHoods(fnc$distance)

pm2 <- mergeByGroup(pm, fnc$cells)
```
plotTissue

Plot cells based on cell position on tissue.

Description

Plot cells based on cell position on tissue.

Usage

plotTissue(
  spe,
  targetcell = FALSE,
  k_near = 100,
  targetsize = 3,
  targetshape = 1,
  targetcolor = "red",
  scaleFactor = 1,
  reverseY = TRUE,
  ...
)

Arguments

spe SpatialExperiment object.

Optional. Can input ONE specific cell id to zoom-in on the region of a specific cell.

Optional. If targetcell is specified, the k_near cells around the targetcell will be plotted.

dot size of the targetcell.

Shape of the targetcell.

Colour of the targetcell.

Scale factor to align with the image.

Reverse y coordinates.

aesthetic mappings to pass to ggplot2::aes_string().

Value

A ggplot object.
readHoodData

Examples

    data("spe_test")

    plotTissue(spe, color = celltypes)

readHoodData

Read cellular position and annotation data into a list object.

Description

Read cellular position and annotation data into a list object.

Usage

    readHoodData(
      spe = NA,
      anno_col = NA,
      cell_pos_dat = NA,
      cell_anno_dat = NA,
      pos_col = NA
    )

Arguments

    spe       SpatialExperiment object.
    anno_col  Character. The column name of the annotation to be used in the following
               neighbourhood analysis.
    cell_pos_dat  data.frame object contains the cellular positions.
    cell_anno_dat  data.frame object contains the cell annotations.
    pos_col  Character. If the x and y are in the colData instead of in the SpatialCoords of
              spe, can specify this parameter.

Value

    A SpatialExperiment object.

Examples

    data("spe_test")

    spe <- readHoodData(spe, anno_col = "celltypes")
**scanHoods**  
_Scan cellular neighbourhoods._

**Description**  
Scan cellular neighbourhoods.

**Usage**  
```r
scanHoods(
  m,
  mode = c("proximityFocused", "smoothFadeout"),
  tau = NA,
  t_init = NA
)
```

**Arguments**  
- **m**  
  Distance matrix. Can be obtained from function `findNearCells`.  
- **mode**  
  Character. Either `proximityFocused` or `smoothFadeout`. By default is `proximityFocused`.  
- **tau**  
  The hyperparameter tau, by default is `median(m**2)/5`  
- **t_init**  
  An initial tau. In the `smoothFadeout` mode, user can provide an initial tau for optimization.

**Value**  
A probability matrix.

**Examples**  
```r
m <- matrix(abs(rnorm(1000 * 100)), 1000, 100)
pm <- scanHoods(m)
```

---

**spe_test**  
Example test spatial transcriptomics data

**Description**  
hoodscanR-package has 1 datasets:  
- **spe_test** Example test spatial transcriptomics data in SpatialExperiment format. This test data is randomly subsetting from the publicly available CosMx non-small cell lung cancer data.  
Usage
   data("spe_test")

Format
   A SpatialExperiment object

Value
   A SpatialExperiment object

Examples
   data(spe_test)
