

Package ‘microbiomeDASim’

June 30, 2022

Type Package

Title Microbiome Differential Abundance Simulation

Version 1.11.0

Author Justin Williams, Hector Corrada Bravo, Jennifer Tom, Joseph Nathaniel Paulson

Maintainer Justin Williams <williazo@ucla.edu>

Description A toolkit for simulating differential microbiome data designed for longitudinal analyses. Several functional forms may be specified for the mean trend. Observations are drawn from a multivariate normal model. The objective of this package is to be able to simulate data in order to accurately compare different longitudinal methods for differential abundance.

form_beta_check	<i>Beta Specification Check</i>
-----------------	---------------------------------

Description

Function for checking that the appropriate beta parameters are specified for each of the mean trend specifications

Usage

```
form_beta_check(form, beta, IP, timepoints)
```

Arguments

form	character value specifying the type of time trend. Options include 'linear', 'quadratic', 'cubic', 'M', 'W', 'L_up', and 'L_down'.
beta	vector specifying the appropriate parameters for functional trend. See details of mean_trend for explanation for each form
IP	vector specifying the inflection points. See details of mean_trend for explanation for each form
timepoints	numeric vector specifying the points to fit the functional trend. @keywords internal

Value

Nothing returned unless an error is returned.

gen_norm_microbiome *Generate Longitudinal Differential Abundance from Multivariate Normal*

Description

Generate Longitudinal Differential Abundance from Multivariate Normal

Usage

```
gen_norm_microbiome(
  features = 10,
  diff_abun_features = 5,
  n_control,
  n_treat,
  control_mean,
  sigma,
  num_timepoints,
  t_interval,
  rho,
  corr_str = c("ar1", "compound", "ind"),
  func_form = c("linear", "quadratic", "cubic", "M", "W", "L_up", "L_down"),
  beta,
  IP = NULL,
  missing_pct,
  missing_per_subject,
  miss_val = NA,
  dis_plot = FALSE,
  plot_trend = FALSE,
  zero_trunc = TRUE,
  asynch_time = FALSE
)
```

Arguments

features	numeric value specifying the number of features/microbes to simulate. Default is 10.
diff_abun_features	numeric value specifying the number of differentially abundant features. Default is 5.
n_control	integer value specifying the number of control individuals
n_treat	integer value specifying the number of treated individuals
control_mean	numeric value specifying the mean value for control subjects. all control subjects are assumed to have the same population mean value.
sigma	numeric value specifying the global population standard deviation for both control and treated individuals.

<code>num_timepoints</code>	integer value specifying the number of timepoints per subject.
<code>t_interval</code>	numeric vector of length two specifying the interval of time from which to draw observations $[t_1, t_q]$. Assumed to be equally spaced over the interval unless <code>asynch_time</code> is set to <code>TRUE</code> .
<code>rho</code>	value for the correlation parameter. must be between $[0, 1]$. see mvrnorm_corr_gen for details.
<code>corr_str</code>	correlation structure selected. see mvrnorm_corr_gen for details.
<code>func_form</code>	character value specifying the functional form for the longitudinal mean trend. see mean_trend for details.
<code>beta</code>	vector value specifying the parameters for the differential abundance function. see mean_trend for details.
<code>IP</code>	vector specifying any inflection points. depends on the type of functional form specified. see mean_trend for details. by default this is set to <code>NULL</code> .
<code>missing_pct</code>	numeric value that must be between $[0, 1]$ that specifies what percentage of the individuals will have missing values.
<code>missing_per_subject</code>	integer value specifying how many observations per subject should be dropped. note that we assume that all individuals must have baseline value, meaning that the maximum number of <code>missing_per_subject</code> is equal to <code>num_timepoints - 1</code> .
<code>miss_val</code>	value used to induce missingness from the simulated data. by default missing values are assumed to be <code>NA</code> but other common choices include <code>0</code> .
<code>dis_plot</code>	logical argument on whether to plot the simulated data or not. by default plotting is turned off.
<code>plot_trend</code>	specifies whether to plot the true mean trend. see mean_trend for details.
<code>zero_trunc</code>	logical indicator designating whether simulated outcomes should be zero truncated. default is set to <code>TRUE</code>
<code>asynch_time</code>	logical indicator designed to randomly sample timepoints over a specified interval if set to <code>TRUE</code> . default is <code>FALSE</code> .

Value

This function returns a list with the following objects

`Y` The full simulated feature sample matrix where each row represent a feature and each column a sample. Note that the differential and non-differential bugs are marked by `row.names`

Examples

```
gen_norm_microbiome(features = 5, diff_abun_features = 2,
  n_control = 10, n_treat = 10, control_mean = 8, sigma = 1,
  num_timepoints = 5, t_interval=c(0, 4), rho = 0.8,
  corr_str = "compound", func_form = "linear", beta = c(0, 1),
  missing_pct = 0.3, missing_per_subject = 2)
```

`gen_norm_microbiome_obs`*Generate Longitudinal Differential Abundance from Multivariate Normal with Observed Data*

Description

Generate Longitudinal Differential Abundance from Multivariate Normal with Observed Data

Usage

```
gen_norm_microbiome_obs(  
  features = 10,  
  diff_abun_features = 5,  
  id,  
  time,  
  group,  
  ref,  
  control_mean,  
  sigma,  
  rho,  
  corr_str = c("ar1", "compound", "ind"),  
  func_form = c("linear", "quadratic", "cubic", "M", "W", "L_up", "L_down"),  
  beta,  
  IP = NULL,  
  dis_plot = FALSE,  
  plot_trend = FALSE,  
  zero_trunc = TRUE  
)
```

Arguments

<code>features</code>	numeric value specifying the number of features/microbes to simulate. Default is 10.
<code>diff_abun_features</code>	numeric value specifying the number of differentially abundant features. Default is 5.
<code>id</code>	vector of length N that identifies repeated measurements for each unit
<code>time</code>	vector of length N that determines when values will be sampled for each unit
<code>group</code>	factor vector with two levels indicating the group assignment for each respective id
<code>ref</code>	character value identifying which group value to treat as control and which value to treat as treatment
<code>control_mean</code>	numeric value specifying the mean value for control subjects. all control subjects are assumed to have the same population mean value.

<code>sigma</code>	numeric value specifying the global population standard deviation for both control and treated individuals.
<code>rho</code>	value for the correlation parameter. must be between [0, 1]. see mvrnorm_corr_gen for details.
<code>corr_str</code>	correlation structure selected. see mvrnorm_corr_gen for details.
<code>func_form</code>	character value specifying the functional form for the longitudinal mean trend. see mean_trend for details.
<code>beta</code>	vector value specifying the parameters for the differential abundance function. see mean_trend for details.
<code>IP</code>	vector specifying any inflection points. depends on the type of functional form specified. see mean_trend for details. by default this is set to NULL.
<code>dis_plot</code>	logical argument on whether to plot the simulated data or not. by default plotting is turned off.
<code>plot_trend</code>	specifies whether to plot the true mean trend. see mean_trend for details.
<code>zero_trunc</code>	logical indicator designating whether simulated outcomes should be zero truncated. default is set to TRUE

Value

This function returns a list with the following objects

Y The full simulated feature sample matrix where each row represent a feature and each column a sample. Note that the differential and non-differential bugs are marked by row.names

Examples

```
set.seed(011520)
id_list <- lapply(seq_len(60), function(i){
  obs <- sample(5:10, size=1)
  id_rep <- rep(i, obs)
})

time_interval <- c(0, 10)
time_list <- lapply(id_list, function(x){
  time_len <- length(x)
  times <- runif(time_len, min=time_interval[1], max=time_interval[2])
  times <- times[order(times)]
})

group_list <- lapply(id_list, function(x){
  group_len <- length(x)
  tx_ind <- sample(seq_len(2), 1)
  tx_group <- ifelse(tx_ind==1, "Control", "Treatment")
  groups <- rep(tx_group, group_len)
})
id <- unlist(id_list)
group <- factor(unlist(group_list), levels = c("Control", "Treatment"))
time <- unlist(time_list)
```

```

# control times
ct <- unlist(lapply(unique(id[group=="Control"]), function(x){
  length(id[id==x])
}))

tt <- unlist(lapply(unique(id[group=="Treatment"]), function(x){
  length(id[id==x])
}))

mean(ct)
mean(tt)

gen_norm_microbiome_obs(features=4, diff_abun_features=2,
  id=id, time=time, group=group, ref="Control", control_mean=2,
  sigma=1, rho=0.7, corr_str="compound", func_form="L_up",
  beta=1, IP=5, zero_trunc=TRUE)

```

ggplot_spaghetti

*Spaghetti Plots using ggplot2***Description**

This function allows the user to create spaghetti plots for individuals with time varying covariates. You can also break this down into subgroups to analyze different trends.

Usage

```

ggplot_spaghetti(
  y,
  id,
  time,
  alpha = 0.2,
  method = "loess",
  jit = 0,
  group = NULL
)

```

Arguments

y	This is the y-axis parameter to specify. Generally it is a continuous variable.
id	This is the id parameter that identifies the unique individuals or units.
time	This is the time vector and must be numeric.
alpha	Scalar value between [0,1] that specifies the transparency of the lineplots.
method	Character value that specifies which type of method to use for fitting. Optional methods come from geom_smooth function.
jit	Scalar value that specifies how much you want to jitter each individual observation. Useful if many of the values share the same y values at a time point.
group	Specifies a grouping variable to be used, and will plot it by color on one single plot.

Details

Note that the data must be in long format.

Value

Plots a time series data by each individual/unit with group trends overlaid.

Examples

```
library(ggplot2)
num_subjects_per_group <- 15
sim_obj <- mvrnorm_sim(n_control=num_subjects_per_group,
                      n_treat=num_subjects_per_group,
                      control_mean=5, sigma=1, num_timepoints=5,
                      t_interval = c(0, 4),
                      rho=0.95, corr_str='ar1', func_form='linear',
                      beta=c(0, 0.25),
                      missing_pct=0.6, missing_per_subject=2)

with(sim_obj$df, suppressWarnings(ggplot_spaghetti(y=Y_obs, id=ID, time=time,
                                                  jit=0.1, group=group)))+
  labs(title="Simulated Microbiome Data from Multivariate Normal",
       y="Normalized Reads", x="Time") +
  scale_linetype_manual(values=c("solid", "dashed"), name="Group") +
  scale_color_manual(values=c("#F8766D", "#00BFC4"), name="Group")
```

mean_trend

Function for Generating Various Longitudinal Mean Trends

Description

In order to investigate different functional forms of longitudinal differential abundance we allow the mean time trend to take a variety of forms. These functional forms include linear, quadratic, cubic, M, W, L_{up}, or L_{down}. For each form the direction/concavity/fold change can be specified using the beta parameter.

Usage

```
mean_trend(
  timepoints,
  form = c("linear", "quadratic", "cubic", "M", "W", "L_up", "L_down"),
  beta,
  IP = NULL,
  plot_trend = FALSE
)
```

Arguments

timepoints	numeric vector specifying the points to fit the functional trend.
form	character value specifying the type of time trend. Options include 'linear', 'quadratic', 'cubic', 'M', 'W', 'L_up', and 'L_down'.
beta	vector specifying the appropriate parameters for the equation. In the case of 'linear', beta should be a two-dimensional vector specifying the intercept and slope. See details for the further explanation of the beta value for each form.
IP	vector specifying the inflection points where changes occur for functional forms M, W, and L trends.
plot_trend	logical value indicating whether a plot should be produced for the time trend. By default this is set to TRUE.

Details

Linear Form Notes:

$$f(x) = \beta_0 + \beta_1 x + \beta_2 x^2$$

- Sign of β_1 determines whether the trend is increasing (+) or decreasing (-)

Quadratic Form Notes:

$$f(x) = \beta_0 + \beta_1 x + \beta_2 x^2$$

- Critical point for quadratic function occurs at the point $\frac{-\beta_1}{2\beta_2}$
- β_2 determines whether the quadratic is concave up (+) or concave down (-)

Cubic Form Notes:

$$f(x) = \beta_0 + \beta_1 x + \beta_2 x^2 + \beta_3 x^3$$

- Point of Inflection for cubic function occurs $\frac{-\beta_2}{(3\beta_3)}$
- Critical points for cubic function occur at $\frac{-\beta_2 \pm \sqrt{\beta_2^2 - 3\beta_1\beta_3}}{3\beta_3}$
- Can generate piecewise linear trends, i.e. 'V' form, by placing either one of the IP points outside of the timepoints specified

M/W Form Notes:

- Must specify beta as (β_0, β_1) and IP as (IP_1, IP_2, IP_3)
- This form should be specified with an initial intercept, β_0 , and slope, β_1 , that will connect to the first point of change (IP) specified.
- Subsequent slopes are constructed such that the mean value at the second IP value and final timepoint are 0
- The mean value at the third IP is set to be equal to the calculated mean value at the first IP based on the specified intercept and slope.
- β_0 =intercept, i.e. timepoint when $y=0$
- β_1 =slope between β_0 and IP_1

L_up Form Notes:

The structure of this form assumes that there is no trend from t_1 to IP_1 . Then at the point of change specified, IP_1 , there occurs a linearly increasing trend with slope equal to β_{slope} up to the last specified timepoint t_q .

- Must specify beta as (β_{slope}), and must be positive
- Specify a single point of change (IP) variable where positive trend will start
- IP must be between $[t_1, t_q]$

L_down Form Notes:

Similarly, the L_down form assumes that there are two region within the range of timepoints. The first region is a decreasing trend and the second region has no trend. The decreasing trend must start with a Y intercept greater than zero, and the slope must be specified as negative. There is one point of change (IP), but this is calculated automatically based on the values of the Y intercept and slope provided, $IP = -\beta_{yintercept} / \beta_{slope}$.

- Must specify beta as ($\beta_{yintercept}, \beta_{slope}$) where $\beta_{yintercept} > 0$ and $\beta_{slope} < 0$
- IP variable should be specified as NULL, if value is provided it will be ignored.

Value

This function returns a list of the following

form - character value repeating the form selected

trend - data.frame with the variables mu representing the estimated mean value at timepoints used for fitting the trend

beta - returning the numeric vector used to fit the functional form

Examples

```
#Quadratic Form
mean_trend(timepoints=seq(0, 6, length.out=20),
           form='quadratic', beta=1/4 * c(-1, 3, -0.5), plot_trend=TRUE)

#M Form
mean_trend(timepoints=seq(0, 10, length.out=100), form='M',
           beta=c(0, 5), IP=10 * c(1/4, 2/4, 3/4), plot_trend=TRUE)
#in this case the IP points are selected so that peaks are evenly
#distributed but this does not have to be true in general

#L_up Form
mean_trend(timepoints=seq(0, 10, length.out=100), form='L_up',
           beta=1, IP=5, plot_trend=TRUE)

#L_down Form
mean_trend(timepoints=seq(0, 10, length.out=100), form='L_down',
           beta=c(4, -0.5), IP=NULL, plot_trend=TRUE)
```

mvrnorm_corr_gen *Generate Multivariate Random Normal Longitudinal Data*

Description

For this methodology we assume that we draw a set of n independent each with q_i observations.

Usage

```
mvrnorm_corr_gen(
  n,
  obs,
  t,
  mu,
  sigma,
  rho,
  corr_str = c("ar1", "compound", "ind"),
  zero_trunc = TRUE
)
```

Arguments

n	integer scalar representing the total number of individuals
obs	vector of length n specifying the number of observations per individual.
t	vector corresponding to the timepoints for each individual.
mu	vector specifying the mean value for individuals.
sigma	scalar specifying the standard deviation for all observations.
rho	numeric scalar value between [0, 1] specifying the amount of correlation between. assumes that the correlation is consistent for all subjects.
corr_str	character value specifying the correlation structure. Currently available methods are 'ar1', 'compound', and 'ind' which correspond to first-order autoregressive, compound or equicorrelation, and independence respectively.
zero_trunc	logical value to specifying whether the generating distribution should come from a multivariate zero truncated normal or an untruncated multivariate normal. by default we assume that zero truncation occurs since this is assumed in our microbiome setting.

Value

This function returns a list with the following objects:

df - data.frame object with complete outcome Y, subject ID, time, group, and outcome with missing data

Y - vector of complete outcome

Mu - vector of complete mean specifications used during simulation

Sigma - block diagonal symmetric matrix of complete data used during simulation

N - total number of observations

Examples

```
size <- 15
reps <- 4
N <- size*reps
mvrnorm_corr_gen(n=size, obs=rep(reps, size), t=rep(seq_len(4), size),
mu=rep(1, N), sigma=2, rho=0.9, corr_str="ar1")
```

mvrnorm_sim

Simulate Microbiome Longitudinal Data from Multivariate Random Normal

Description

This function is used in the [gen_norm_microbiome](#) call when the user specified the method as mvrnorm.

Usage

```
mvrnorm_sim(
  n_control,
  n_treat,
  control_mean,
  sigma,
  num_timepoints,
  t_interval,
  rho,
  corr_str = c("ar1", "compound", "ind"),
  func_form = c("linear", "quadratic", "cubic", "M", "W", "L_up", "L_down"),
  beta,
  IP = NULL,
  missing_pct,
  missing_per_subject,
  miss_val = NA,
  dis_plot = FALSE,
  plot_trend = FALSE,
  zero_trunc = TRUE,
  asynch_time = FALSE
)
```

Arguments

n_control	integer value specifying the number of control individuals
n_treat	integer value specifying the number of treated individuals
control_mean	numeric value specifying the mean value for control subjects. all control subjects are assumed to have the same population mean value.
sigma	numeric value specifying the global population standard deviation for both control and treated individuals.
num_timepoints	either an integer value specifying the number of timepoints per subject or a vector of timepoints for each subject. If supplying a vector the length of the vector must equal the total number of subjects.
t_interval	numeric vector of length two specifying the interval of time from which to draw observations [t_l, t_q]. Assumed to be equally spaced over the interval unless asynch_time is set to TRUE.
rho	value for the correlation parameter. must be between [0, 1]. see mvrnorm_corr_gen for details.
corr_str	correlation structure selected. see mvrnorm_corr_gen for details.
func_form	character value specifying the functional form for the longitudinal mean trend. see mean_trend for details.
beta	vector value specifying the parameters for the differential abundance function. see mean_trend for details.
IP	vector specifying any inflection points. depends on the type of functional form specified. see mean_trend for details. by default this is set to NULL.
missing_pct	numeric value that must be between [0, \1] that specifies what percentage of the individuals will have missing values.
missing_per_subject	integer value specifying how many observations per subject should be dropped. note that we assume that all individuals must have baseline value, meaning that the maximum number of missing_per_subject is equal to num_timepoints - 1.
miss_val	value used to induce missingness from the simulated data. by default missing values are assumed to be NA but other common choices include 0.
dis_plot	logical argument on whether to plot the simulated data or not. by default plotting is turned off.
plot_trend	specifies whether to plot the true mean trend. see mean_trend for details.
zero_trunc	logical indicator designating whether simulated outcomes should be zero truncated. default is set to TRUE
asynch_time	logical indicator designed to randomly sample timepoints over a specified interval if set to TRUE. default is FALSE.

Value

This function returns a list with the following objects:

df - data.frame object with complete outcome Y, subject ID, time, group, and outcome with missing data

Y - vector of complete outcome

Mu - vector of complete mean specifications used during simulation

Sigma - block diagonal symmetric matrix of complete data used during simulation

N - total number of observations

miss_data - data.frame object that lists which ID's and timepoints were randomly selected to induce missingness

Y_obs - vector of outcome with induced missingness

Examples

```
num_subjects_per_group <- 20
sim_obj <- mvrnorm_sim(n_control=num_subjects_per_group,
                      n_treat=num_subjects_per_group,
                      control_mean=5, sigma=1, num_timepoints=5,
                      t_interval=c(0, 4), rho=0.95, corr_str='ar1',
                      func_form='linear', beta=c(0, 0.25),
                      missing_pct=0.6, missing_per_subject=2)

#checking the output
head(sim_obj$df)

#total number of observations is 2(num_subjects_per_group)(num_timepoints)
sim_obj$N

#there should be approximately 60% of the IDs with missing observations
length(unique(sim_obj$miss_data$miss_id))/length(unique(sim_obj$df$ID))

#checking the subject covariance structure
sim_obj$Sigma[seq_len(5), seq_len(5)]
```

mvrnorm_sim_obs

Simulate Microbiome Longitudinal Data from Multivariate Random Normal with Observed Data

Description

This function is used in the [gen_norm_microbiome_obs](#) call.

Usage

```
mvrnorm_sim_obs(
  id,
  time,
  group,
  ref,
```

```

    control_mean,
    sigma,
    rho,
    corr_str = c("ar1", "compound", "ind"),
    func_form = c("linear", "quadratic", "cubic", "M", "W", "L_up", "L_down"),
    beta,
    IP = NULL,
    dis_plot = FALSE,
    plot_trend = FALSE,
    zero_trunc = TRUE
  )

```

Arguments

id	vector of length N that identifies repeated measurements for each unit
time	vector of length N that determines when values will be sampled for each unit
group	factor vector with two levels indicating the group assignment for each respective id
ref	character value identifying which group value to treat as control and which value to treat as treatment
control_mean	numeric value specifying the mean value for control subjects. all control subjects are assumed to have the same population mean value.
sigma	numeric value specifying the global population standard deviation for both control and treated individuals.
rho	value for the correlation parameter. must be between [0, 1]. see mvrnorm_corr_gen for details.
corr_str	correlation structure selected. see mvrnorm_corr_gen for details.
func_form	character value specifying the functional form for the longitudinal mean trend. see mean_trend for details.
beta	vector value specifying the parameters for the differential abundance function. see mean_trend for details.
IP	vector specifying any inflection points. depends on the type of functional form specified. see mean_trend for details. by default this is set to NULL.
dis_plot	logical argument on whether to plot the simulated data or not. by default plotting is turned off.
plot_trend	specifies whether to plot the true mean trend. see mean_trend for details.
zero_trunc	logical indicator designating whether simulated outcomes should be zero truncated. default is set to TRUE

Value

This function returns a list with the following objects:

df - data.frame object with complete outcome Y, subject ID, time, group, and outcome with missing data

Y - vector of complete outcome
 Mu - vector of complete mean specifications used during simulation
 Sigma - block diagonal symmetric matrix of complete data used during simulation
 N - total number of observations

Examples

```

set.seed(011520)
id_list <- lapply(seq_len(30), function(i){
  obs <- sample(seq_len(10), size=1)
  id_rep <- rep(i, obs)
})

time_interval <- c(0, 10)
time_list <- lapply(id_list, function(x){
  time_len <- length(x)
  times <- runif(time_len, min=time_interval[1], max=time_interval[2])
  times <- times[order(times)]
})

group_list <- lapply(id_list, function(x){
  group_len <- length(x)
  tx_ind <- sample(seq_len(2), 1)
  tx_group <- ifelse(tx_ind==1, "Control", "Treatment")
  groups <- rep(tx_group, group_len)
})
id <- unlist(id_list)

```

```
beta=1, IP=5, plot_trend=TRUE, dis_plot=TRUE, zero_trunc=TRUE)
```

simulate2MRExperiment *Convert simulated output to MRExperiment object*

Description

In order to allow investigators to more easily incorporate simulated data, this package converts the raw output into an MRExperiment object used in the [metagenomeSeq](#) package.

Usage

```
simulate2MRExperiment(obj, missing = FALSE)
```

Arguments

obj	output from either gen_norm_microbiome or mvrnorm_sim
missing	logical indicator for objects from mvrnorm_sim . If missing = TRUE then create MRExperiment object with Y_obs else use Y.

Value

An MRExperiment object

Examples

```
bug_gen <- gen_norm_microbiome(features=6, diff_abun_features=3,
                              n_control=30, n_treat=20, control_mean=2,
                              sigma=2, num_timepoints=4, t_interval=c(0, 3),
                              rho=0.9, corr_str="compound", func_form="M",
                              beta=c(4, 3), IP=c(2, 3.3, 6),
                              missing_pct=0.2, missing_per_subject=2,
                              miss_val=0, asynch_time=TRUE)
bug_gen_MR <- simulate2MRExperiment(bug_gen)
class(bug_gen_MR)
```

simulate2phyloseq *Convert simulated output to phyloseq object*

Description

This function will convert simulated data into a `phyloseq` object.

Usage

```
simulate2phyloseq(obj, missing = FALSE)
```

Arguments

<code>obj</code>	output from either <code>gen_norm_microbiome</code> or <code>mvrnorm_sim</code>
<code>missing</code>	logical indicator for objects from <code>mvrnorm_sim</code> . If <code>missing = TRUE</code> then create MRexperiment object with <code>Y_obs</code> else use <code>Y</code> .

Value

A `phyloseq` object

Examples

```
bug_gen <- gen_norm_microbiome(features=6, diff_abun_features=3,
                              n_control=30, n_treat=20, control_mean=2,
                              sigma=2, num_timepoints=4, t_interval=c(0, 3),
                              rho=0.9, corr_str="compound", func_form="M",
                              beta=c(4, 3), IP=c(2, 3.3, 6),
                              missing_pct=0.2, missing_per_subject=2,
                              miss_val=0, asynch_time=TRUE)
bug_gen_phyloseq <- simulate2MRexperiment(bug_gen)
class(bug_gen_phyloseq)
```
