annotate-methods

Automatic deconvolution/annotation of LC/ESI-MS data

Description

Wrapper script for automatic annotation of isotope peaks, adducts and fragments for a (grouped) xcmsSet xs. The function returns an xsAnnotate object.

Usage

annotate(object, sample=NA, nSlaves=1, sigma=6, perfwhm=0.6, cor_eic_th=0.75, graphMethod="hcs", pval=0.05, calcCiS=TRUE, calcIso=FALSE, calcCaS=FALSE, maxcharge=3, maxiso=4, minfrac=0.5, ppm=5, mzabs=0.015, quick=FALSE, psg_list=NULL, rules=NULL, polarity="positive", multiplier=3, max_peaks=100, intval="into")

Arguments

object xcmsSet with peak group assignments
sample xsAnnotate: Sample selection for grouped xcmsSet, see xsAnnotate-class
nSlaves xsAnnotate: Use parallel CAMERA mode, require Rmpi
sigma groupFWHM: multiplier of the standard deviation
perfwhm groupFWHM: percentage of FWHM width
cor_eic_th groupCorr: correlation threshold (0..1)
graphMethod groupCorr: Method selection for grouping peaks after correlation analysis into pseudospectra
pval groupCorr: significant correlation threshold
calcCiS groupCorr: Use correlation inside samples for peak grouping
calcIso groupCorr: Use isotopic relationship for peak grouping
calcCaS groupCorr: Use correlation across samples for peak grouping
maxcharge findIsotopes: max. ion charge
maxiso findIsotopes: max. number of expected isotopes
minfrac findIsotopes: The percentage number of samples, which must satisfy the C12/C13 rule for isotope annotation
ppm General ppm error
mzabs General absolut error in m/z
quick Use only groupFWHM and findIsotopes
psg_list Calculation will only be done for the selected groups
rules findAdducts: User defined ruleset
polarity findAdducts: Which polarity mode was used for measuring of the ms sample
multiplier findAdducts: If no ruleset is provided, calculate ruleset with max. number n of \([nM+x]\) clusterions
max_peaks How much peaks will be calculated in every thread using the parallel mode
intval General used intensity value (into, maxo, intb)
Details

Batch script for annotation of an (grouped) xcmsSet xs. Generates an xsAnnotate object by calling all involved functions for the annotation step. Function list: 1: groupFWHM(), 2: findIsotopes(), 3: groupCorr(), 4: findAdducts() Return the xsAnnotate object, which inherits all annotations. For more information about the parameters see the specific function manpages.

Value

annotate returns an xsAnnotate object. For more information about the xsAnnotate object see xsAnnotate-class.

Author(s)

Carsten Kuhl <ckuhl@ipb-halle.de>

Examples

library(CAMERA)
file <- system.file(’mzML/MM14.mzML’, package = ’CAMERA’)
x <- xcmsSet(file, method=”centWave”, ppm=30, peakwidth=c(5,10))
xsa <- annotate(xs)

annotateDiffreport

Automatic deconvolution/annotation of LC/ESI-MS data

Description

Wrapper function for the xcms diffreport and the annotate function. Returns a diffreport within the annotation results.

Usage

annotateDiffreport(object, sample=NA, nSlaves=1, sigma=6, perfwhm=0.6, cor_eic_th=0.75, cor_exp_th = 0.75, graphMethod=”hcs”, pval=0.05, calcCiS=TRUE, calcIso=FALSE, calcCaS=FALSE, maxcharge=3, maxiso=4, minfrac=0.5, ppm=5, mzabs=0.015, quick=FALSE, psg_list=NULL, rules=NULL, polarity=”positive”, multiplier=3, max_peaks=100, intval=”into”, pval_th = NULL, fc_th = NULL, sortpval=TRUE, ...)

Arguments

object xcmsSet with peak group assignments
sample xsAnnotate: Sample selection for grouped xcmsSet, see xsAnnotate-class
nSlaves xsAnnotate: Use parallel CAMERA mode, require Rmpi
sigma groupFWHM: multiplier of the standard deviation
perfwhm groupFWHM: percentage of FWHM width
annotateDiffreport

cor_eic_th  groupCorr: Correlation threshold for EIC correlation (0..1)
cor_exp_th  groupCorr: Threshold for intensity correlations across samples (0..1)
graphMethod groupCorr: Method selection for grouping peaks after correlation analysis into pseudospectra
pval   groupCorr: significant correlation threshold
calcCiS  groupCorr: Use correlation inside samples for peak grouping
calcIso  groupCorr: Use isotopic relationship for peak grouping
calcCaS  groupCorr: Use correlation across samples for peak grouping
maxcharge findIsotopes: max. ion charge
maxiso findIsotopes: max. number of expected isotopes
minfrac findIsotopes: The percentage number of samples, which must satisfy the C12/C13 rule for isotope annotation
ppm General ppm error
mzabs General absolut error in m/z
quick Use only groupFWHM and findIsotopes
psg_list Calculation will only be done for the selected groups
rules findAdducts: User defined ruleset
polarity findAdducts: Which polarity mode was used for measuring of the ms sample
multiplier findAdducts: If no ruleset is provided, calculate ruleset with max. number n of [nM+x] clusterions
max_peaks How much peaks will be calculated in every thread using the parallel mode
intval General used intensity value (into, maxo, intb)
pval_th pval threshold. Creates a new psg_list. A pseudospectra is selected if it contains peaks, with pval < pval_th
fc_th Same as pval. Select those groups with contains peaks with fold-change > fc_th. Pval_th and fc_th can be combined
sortpval Sort diffreport after pvalues
...
Diffreport parameters see diffreport

Details
Batch script wrapper for combining the annotation and the diffreport for a (grouped) xcmsSet xs. Function list: 1: diffreport(), 2: groupFWHM(), 3: findIsotopes(), 4: groupCorr(), 5: findAdducts() For a speedup calculation users can create a quick run, with quick = TRUE to preselect pseudospectra of interest. The indices of those pseudospectra are set with psg_list in a second run. On the other hand, a automatic selection with pval_th and/or fc_th can be performed. Returns the normal xcms diffreport table, with the additional CAMERA slots

Value
annotateDiffreport returns an diffreport, see diffreport, within additional columns containing the annotation results.
Author(s)
Carsten Kuhl <ckuhl@ipb-halle.de>

Examples

```r
#Multiple sample
library(CAMERA)
library(faahKO)
x.grp <- group(faahko)
x.fill <- fillPeaks(xs.grp)

#fast preselection
# diffreport <- annotateDiffreport(xs.fill, quick=TRUE)
# index <- c(1,18,35,45,56) #Make only for those grps a adduct annotation
# diffreport2 <- annotateDiffreport(xs.fill, psg_list=index, metlin = TRUE)

#automatic selection for groups with peaks p-val < 0.05 and fold-change > 3
# diffreport <- annotateDiffreport(xs.fill, pval_th=0.05, fc=3)
```

calcCaS-methods

**EIC correlation grouping of LC/ESI-MS data**

Description

Calculate the correlation across samples. Filtering correlation with specific parameters and returns a correlation matrix.

Usage

```r
calcCaS(object, corval=0.75, pval=0.05, intval="into")
```

Arguments

- **object**: The **xsAnnotate** object
- **corval**: Correlation threshold for positive hits
- **pval**: P-Value threshold for significance level of correlation
- **intval**: Selection of the intensity values that should be used in the correlation analysis. Can be into, maxo or intb.

Details

Calculate pearson correlation between the peak intensites over all samples. Afterwards use cor.test for returning only significant correlation. Returns only those correlation, which are above both threshold. Set corval and pval to 0 to get the unfiltered correlation matrix. If the object is pregrouped with `groupFWHM`, then the correlation is only calculated between peaks within a pseudospectrum. Otherwise between all peaks.
Value

A matrix with 4 columns:

- \( x \)  peak index according to peaktable
- \( y \)  peak index according to peaktable
- \( \text{cor} \)  correlation value between peak \( x \) and peak \( y \)
- \( \text{ps} \)  pseudospektrum index for both peaks

Author(s)

Carsten Kuhl <ckuhl@ipb-halle.de>

See Also

calcCiS groupCorr xsAnnotate-class

Examples

```r
library(CAMERA)
# Multiple sample
library(faahKO)
x.s.grp <- group(faahKO)
# create xsAnnotate object
xsa <- xsAnnotate(x.s.grp)
# generate pseudospectra
xsa.group <- groupFWHM(xsa)
# calculate correlation
correlationMatrix <- calcCaS(xsa.group)
```

Description

Processing an xsAnnotate object and correlates peak EIC curves from one pseudospectrum, using a precalculated EIC matrix (getAllPeakEICs). It return a weighted edge list as distance matrix between peaks according to the correlation analysis. The edge value is the pearson correlation coefficient. The list can be used as input for calcPC.

Usage

calcCiS(object, EIC=EIC, corval=0.75, pval=0.05, psg_list=NULL)
Arguments

- **object**: The xsAnnotate object
- **EIC**: EIC Matrix
- **corval**: Correlation threshold for the EIC correlation
- **pval**: p-value for testing correlation of significance
- **psg_list**: Vector of pseudospectra indices. The correlation analysis will be only done for those groups

Details

The algorithm correlates the EIC of a every peak with all others, to find the peaks that belong to one substance. LC/MS data should grouped with groupFWHM first. This step reduce the runtime a lot and increased the number of correct classifications. Only correlation with a higher value than the correlation threshold and significant p-values will be returned.

Value

A matrix with 4 columns:

- **x**: peak index
- **y**: peak index
- **cor**: correlation value
- **ps**: pseudospectrum index, which contains x and y

Author(s)

Carsten Kuhl <ckuhl@ipb-halle.de>

See Also

calcCaS groupCorr getAllPeakEICs xsAnnotate-class

calcIsotopes-methods  Calculate isotope distance matrix from xsAnnotate object

Description

Processing an xsAnnotate object with annotated isotopes (findIsotopes). It return a weighted edge list as distance matrix between peaks according to the isotope annotation. The edge value for recognized isotopes is 1 for all cases. The list can be used as input for calcPC.

Arguments

- **object**: xsAnnotate object
Value
A matrix with 4 columns:

<table>
<thead>
<tr>
<th>x</th>
<th>peak index</th>
</tr>
</thead>
<tbody>
<tr>
<td>y</td>
<td>peak index</td>
</tr>
<tr>
<td>cor</td>
<td>edge value, always 1</td>
</tr>
<tr>
<td>ps</td>
<td>pseudospectrum index, which contains x and y</td>
</tr>
</tbody>
</table>

Methods

```r
object = "xsAnnotate"  calcIsotopes(object)
```

Author(s)

Carsten Kuhl, <ckuhl@ipb-halle.de>

calcPC xsAnnotate-class

calcPC-methods

Peakclustering into pseudospectra according to a distance matrix

Description

A number of clustering methods exist in CAMERA. calcPC is the generic method.

Usage

```r
calcPC(object, method, ...)
```

Arguments

- `object`: `xsAnnotate-class` object
- `method`: Method to use for clustering. See details.
- `...`: Optional arguments to be passed along

Details

This algorithm clusters peaks from a `xsAnnotate` object into pseudospectra according to a provided distance matrix. Therefore all peaks are transformed into a graph, with peaks as nodes and the value from the distance matrix as edges. Afterwards a graph separation algorithm is applied, which searches in the graph for clusters. See the manpages of the specific clustering algorithms for more information.

If the `xsAnnotate` is pregrouped, for example `groupFWHM`, only the already existing groups will be further processed.
The different algorithms that can be used by specifying them with the method argument. For example to use the highly connected subgraphs approach by E. Hartuv, R. Shamir, (1999), one would use: calcPC(object, method="hcs"). This is also the default, see calcPC.hcs.

Further arguments given by ... are passed through to the function implementing the method, which are most likely ajc. The parameter ajc is the peak distance matrix. 

getOption("BioC")$CAMERA$findPeaks.methods returns a character vector of nicknames for the algorithms available.

The function returns a xsAnnotate object with grouping information, as list of peak indices. They are stored as object@pspectra.

See Also

calcPC.lpc calcPC.hcs xsAnnotate-class

calcPC.hcs

Peakclustering into pseudospectra with the highly connected subgraphs approach

Description

Cluster peaks from an xsAnnotate object into pseudospectra

Arguments

object xsAnnotate object
ajc Weighted symbolic edge list as four column matrix ("x","y","cor","ps"). Columns x,y are peak indices, cor the edge value and ps the pseudospectrum index, where both peaks occur.
psg_list additional vector ps pseudospectra indices, which are used in the clustering. If set to NULL all pseudospectra will be processed.

Details

In some cases, is the peak grouping after retentiontime with groupFWHM not enough to separate co-elution compounds. Therefore groupCorr use additional correlation analysis to achieve a separation. calcPC is part of this approach, which takes the calculated weighted edge list and performs the graph clustering. It returns an xsAnnotate object with further separated pseudospectra.

Methods

object = "xsAnnotate" calcPC.hcs(object, ajc=NULL, psg_list=NULL)

Author(s)

Carsten Kuhl, ckuhl@ipb-halle.de
**calcPC.lpc**

**See Also**

calcPC groupCorr highlyConnSG xsAnnotate-class

---

**calcPC.lpc** *Peakclustering into pseudospectra with the label-propagation-community algorithm*

**Description**

Cluster peaks from an xsAnnotate object into pseudospectra

**Arguments**

- **object** xsAnnotate object
- **ajc** Weighted symbolic edge list as four column matrix ("x","y","cor","ps"). Columns x,y are peak indices, cor the edge value and ps the pseudospectrum index, where both peaks occur.
- **psg_list** additional vector ps pseudospectra indices, which are used in the clustering. If set to NULL all pseudospectra will be processed.

**Details**

In some cases, is the peak grouping after retentiontime with groupFWHM not enough to separate co-elution compounds. Therefore groupCorr use additional correlation analysis to achieve a separation. calcPC is part of this approach, which takes the calculated weighted edge list and performs the graph clustering. It returns an xsAnnotate object with further separated pseudospectra.

**Methods**

`object = "xsAnnotate"`  `calcPC.lpc(object, ajc=NULL, psg_list=NULL)`

**Author(s)**

Carsten Kuhl, <ckuhl@ipb-halle.de>

**See Also**

calcPC groupCorr xsAnnotate-class label.propagation.community
cleanParallel  

**Cleans up with spawned slave processes after use**

**Description**

The spawned slaves processes, which are created within the parallel mode, are closed explicit.

**Usage**

`cleanParallel(object)`

**Arguments**

- `object`  
  xsAnnotate object

**Details**

The function needs a xsAnnotate object after groupCorr or groupFWHM. The resulting object is a artificial xcmsSet, where the peaks with the specific neutral loss are stored in xcmsSet@peaks.

**Author(s)**

Carsten Kuhl <ckuhl@ipb-halle.de>

**Examples**

```r
## Not run: library(CAMERA)
file <- system.file('mzML/MM14.mzML', package = "CAMERA")
xs <- xcmsSet(file, method="centWave", ppm=30, peakwidth=c(5,10))
an <- xsAnnotate(xs, polarity="positive", nSlaves=2)
an <- groupFWHM(an)
an <- findAdducts(an)
cleanParallel(an)
## End(Not run)
```

combinexsAnnos  

**Check CAMERA ion species annotation due to matching with opposite ion mode**

**Description**

This function check annoations of ion species with the help of a sample from opposite ion mode. As first step it searches for pseudospectra from the positive and the negative sample within a retention time window. For every result the m/z differences between both samples are matched against specific rules, which are combinations from pos. and neg. ion species. As example M+H and M-H with a m/z difference of 2.014552. If two ions matches such a difference, the ion annotations are changed (previous annotation is wrong), confirmed or added. Returns the peaklist from one ion mode with recalculated annotations.
combinexsAnnos(xsa.pos, xsa.neg, pos=TRUE, tol=2, ruleset=NULL)

Arguments

xsa.pos xsAnnotate object with positive ion mode
xsa.neg xsAnnotate object with negative ion mode
pos If TRUE the peaklist from the positive mode is returned, if FALSE the negative
tol Retention time window in seconds
ruleset Matrix of matching rules, see example

Details

Both xsAnnotate object should be full processed (grouping and annotation). Without previous annotation the resulting peaklist only includes annotation with matches peaks from both mode according to the rule(s). With ruleset=NULL the function only looks for M+H/M-H pairs. The ruleset is a two column matrix with includes rule indices from the rule table of both xsAnnotate objects. ruleset <- cbind(1,1) would create the M+H/M-H rule, since the first rule of xsa.pos@ruleset and xsa.neg@ruleset is M+H respectively M-H. Only rules with identical charge can be combined!

Value

Returns a (normal) CAMERA peaklist with an additional column neg. Mode or pos. Mode, where matching peaks from the opposite mode are noted.

Author(s)

Carsten Kuhl <ckuhl@ipb-halle.de>

Examples

## Not run:
#Searches for M+H/M-H combinations within a retention time window of 2 seconds
peaklist.pos <- combinexsAnnos(xsa.pos, xsa.neg, tol=2)

## End(Not run)

compoundLibraries

The supported compound databases

Description

Returns a set of supported compound databases

Usage

compoundLibraries()
Value
Vector of supported compound databases

Author(s)
Hendrik Treutler

Examples

compoundLibraries()

---

compoundQuantiles

compoundQuantiles constructor

Description

constructor of class compoundQuantiles

Usage

compoundQuantiles(compoundLibrary = "kegg", massWindowSize = 50)

Arguments

compoundLibrary
the database; see compoundLibraries() for a list of supported databases

massWindowSize
the mass window size for grouping compounds; see massWindowSizes(compoundLibrary = "kegg") for a list of supported databases for e.g. the database kegg

Value

the compoundQuantiles object

Author(s)
Hendrik Treutler

Examples

cpObj <- compoundQuantiles()
Class `compoundQuantiles` encapsulates compound statistics from different databases.

**Description**

The user is able to get the expected number of atoms of element e (C, N, ...) for a compound of mass m for a q-quantile. I.e. `getAtomCount(object = compoundQuantiles(), element = e, mass = m, quantile = q)` returns the number of atoms of element e in a compound of mass m in the lowest-(q*100) (sorted ascending by the possible number of atoms of element e for compounds of such mass).

The user is able to get the expected proportion between the intensities of two isotope peaks for a compound of mass m for a q-quantile. I.e. `getIsotopeProportion(object = compoundQuantiles(isotope1 = i1, isotope2 = i2, mass = m, quantile = q)` returns the isotope proportion i1 / i2 for a compound of mass m in the lowest-(q*100) (sorted ascending by the possible isotope proportions for compounds of such mass).

**Objects from the Class**

Objects can be created with the `compoundQuantiles` constructor.

**Slots**

- `compoundLibrary`: The compound library to rely on (kegg, chebi, ...)
- `massWindowSize`: The mass window size of the compound statistics (25, 100, ...)
- `minCompoundMass`: Minimum compound mass for which there are statistics
- `maxCompoundMass`: Maximum compound mass for which there are statistics
- `numberOfMassWindows`: Number of mass windows
- `numberOfIsotopes`: Number of isotopes for which there are isotope ratio quantiles
- `isotopeSet`: The set of isotopes for which there are isotope ratio quantiles
- `elementSet`: The set of elements for which there are element count statistics
- `quantileSet`: The set of quantiles for which there are isotope ratio statistics
- `eleCounters_e_q_mw`: Three dimensional array containing the element count statistics (element, quantile, mass window index)
- `proportions_i_q_mw`: Three dimensional array containing the isotope ratio quantiles relative to the monoisotopic peak (isotope index, quantile, mass window index)

**Methods**

- `getAtomCount` signature(object = "xsAnnotate"): returns the number of atoms of the specified element for the given quantile and mass window index
- `getIsotopeProportion,compoundQuantiles-method` signature(object = "xsAnnotate"): returns the isotope ratio of the specified isotope for the given quantile and mass window index relative to the monoisotopic peak
findAdducts-methods

Calculate Adducts and Annotate LC/ESI-MS Spectra

Description
Annotate adducts (and fragments) for a xsAnnotate object. Returns a xsAnnotate object with annotated pseudospectra.

Usage
findAdducts(object, ppm=5, mzabs=0.015, multiplier=3, polarity=NULL, rules=NULL, max_peaks=100, psg_list=NULL, intval="maxo")

Arguments
- **object**: the xsAnnotate object
- **ppm**: ppm error for the search
- **mzabs**: allowed variance for the search
- **multiplier**: highest number(n) of allowed clusterion [nM+ion]
- **polarity**: Which polarity mode was used for measuring of the ms sample
- **rules**: personal ruleset or with NULL standard ruleset will be calculated
- **max_peaks**: If run in parralel mode, this number defines how much peaks will be calculated in every thread
- **psg_list**: Vector of pseudospectra indices. The correlation analysis will be only done for those groups
- **intval**: choose intensity values. Allowed values are into, maxo, intb

Details
Adducts (and fragments) are annotated for a xsAnnotate object. For every pseudospectra group, generated bei groupFWHM and groupCorr, all possible Adducts are calculated and mapped to the peaks. If at least two adducts match, a possible molecule-mass for the group can be calculated. After the annotation every masshypothese is checked against the charge of the calculated isotopes. It is recommend to call findIsotopes() before the annotation step.
findIsotopes

Author(s)
Carsten Kuhl <ckuhl@ipb-halle.de>

Examples

library(CAMERA)
file <- system.file('mzML/MM14.mzML', package = "CAMERA")
xs <- xcmsSet(file, method="centWave", ppm=30, peakwidth=c(5,10))
an <- xsAnnotate(xs)
an <- groupFWHM(an)
an <- findIsotopes(an) # optional but recommended.
#an <- groupCorr(an) # optional but very recommended step
an <- findAdducts(an,polarity="positive")
peaklist <- getPeaklist(an) # get the annotated peak list

Description

Annotate isotope peaks for a xsAnnotate object. Returns a xsAnnotate object with annotated isotopes.

Usage

findIsotopes(object, maxcharge=3, maxiso=4, ppm=5, mzabs=0.01, intval=c("maxo","into","intb"), minfrac=0.5, isotopeMatrix = NULL, filter = TRUE)

Arguments

<table>
<thead>
<tr>
<th></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object</td>
<td>the xsAnnotate object</td>
</tr>
<tr>
<td>maxcharge</td>
<td>max. number of the isotope charge</td>
</tr>
<tr>
<td>maxiso</td>
<td>max. number of the isotope peaks</td>
</tr>
<tr>
<td>ppm</td>
<td>ppm error for the search</td>
</tr>
<tr>
<td>mzabs</td>
<td>allowed variance for the search</td>
</tr>
<tr>
<td>intval</td>
<td>choose intensity values for C12/C13 check. Allowed values are into, maxo, intb</td>
</tr>
<tr>
<td>minfrac</td>
<td>in case of multiple samples, percentaged value of samples, which have to contain the correct C12/C13 ratio and are not NA</td>
</tr>
<tr>
<td>isotopeMatrix</td>
<td>four column m/z-diff and ratio Matrix, for matching isotopic peaks.</td>
</tr>
<tr>
<td>filter</td>
<td>Should C12/C13 filter be applied</td>
</tr>
</tbody>
</table>
Details

Isotope peaks are annotated for a xsAnnotate object according to given rules (maxcharge, maxiso). The algorithm benefits from an earlier grouping of the data, with groupFWHM. Generates a list of all possible isotopes, which is stored in object@isotopes. Those isotope information will be used in the groupCorr function. The intensity of the C13 isotope peak is checked against the C12 of proper ratio. In the case of multiple samples, all samples will be tested. Minfrac describe the minimal percentage of samples, which must pass the test. If peaks are NA, then this sample is skipped and the ratio is (found correct C12/C13 ratio) / (samples containing C12 and C13 peak).

Author(s)

Carsten Kuhl <ckuhl@ipb-halle.de>

Examples

library(CAMERA)
file <- system.file('mzML/MM14.mzML', package = "CAMERA")
xs <- xcmsSet(file, method="centWave", ppm=30, peakwidth=c(5,10))
an <- xsAnnotate(xs)
an <- groupFWHM(an)
an <- findIsotopes(an)

findIsotopesWithValidation

Description

Annotate validated isotope clusters for a xsAnnotate object. Returns a xsAnnotate object with annotated isotopes. Validation of isotope clusters is based on statistics of the KEGG database implemented in S4 class object compoundQuantiles.

Usage

findIsotopesWithValidation(object, maxcharge=3, ppm=5, mzabs=0.01, intval=c("maxo","into","intb"), validateIsotopePatterns = TRUE, database="kegg")

Arguments

object the xsAnnotate object
maxcharge max. number of the isotope charge
ppm ppm error for the search
mzabs allowed variance for the search
intval choose intensity values for C12/C13 check. Allowed values are into, maxo, intb
validateIsotopePatterns logical, if TRUE putative isotope clusters are validated based on KEGG database statistics.
database the database which is the basis for isotope cluster validation. One of compoundLibraries().
findKendrickMasses

Details

Isotope peaks are annotated for a xsAnnotate object according to given rules (maxcharge, maxiso). The algorithm benefits from an earlier grouping of the data, with groupFWHM. Generates a list of all possible isotopes, which is stored in object@isotopes. Those isotope information will be used in the groupCorr function. The ratios between isotope peaks are checked against the mass–specific 99% confidence interval based on statistics of the KEGG database.

findIsotopes

Examples

library(CAMERA)
file <- system.file('mzML/MM14.mzML', package = "CAMERA")
xs <- xcmsSet(file, method="centWave", ppm=30, peakwidth=c(5,10))
an <- xsAnnotate(xs)
an <- groupFWHM(an)
an <- findIsotopesWithValidation(an)

findKendrickMasses(object, masses=c(14, 14.01565),
maxHomologue=4, error=0.002, time=60, intval="maxo",
plot=FALSE)
findNeutralLoss

Arguments

- **object**: xsAnnotate object
- **masses**: nominal mass and exact mass
- **error**: allowed mass difference in Da for matching Kendrick mass defect
- **maxHomologue**: max number of homologue
- **time**: allowed retention time difference between homologues
- **intval**: intensity value (allowed values: maxo,into or intb)
- **plot**: plot hits

Author(s)

Carsten Kuhl <ckuhl@ipb-halle.de>

Examples

```r
library(CAMERA)
library(faahKO)
xs <- group(faahko)
# With specific selected sample
xsa <- xsAnnotate(xs)
# Screen for substance with CH2 differences
findKendrickMasses(xsa, masses=c(14, 14.01565), plot=TRUE)
```

Description

The method searches in every pseudospectra for a distance between two ions matching a provided mass difference. It returns a xcmsSet object containing the matching peaks.

Usage

```
findNeutralLoss(object, mzdiff=NULL, mzabs=0, mzppm=10)
```

Arguments

- **object**: xsAnnotate object
- **mzdiff**: neutral loss in Dalton
- **mzabs**: absolut allowed mass difference
- **mzppm**: relative allowed mass difference
findNeutralLossSpecs

Details

The function needs a xsAnnotate object after groupCorr or groupFWHM. The resulting object is an artificial xcmsSet, where the peaks with the specific neutral loss are stored in xcmsSet@peaks.

Author(s)

Carsten Kuhl <ckuhl@ipb-halle.de>

Examples

```r
library(CAMERA)
file <- system.file('mzML/MM14.mzML', package = "CAMERA")
x <- xcmsSet(file, method="centWave", ppm=30, peakwidth=c(5,10))
an <- xsAnnotate(x)
an <- groupFWHM(an)
# Searches for Peaks with water loss
xs.pseudo <- findNeutralLoss(an,mzdiff=18.01,mzabs=0.01)
x.pseudo@peaks # show Hits
```

findNeutralLossSpecs  Find pseudospectra that contains a specific neutral loss

Description

The method searches in every pseudospectra for a distance between two ions matching a provided mass difference. It returns a boolean vector with the length equals to the number of pseudospectra, where a hit is marked with TRUE.

Usage

```r
findNeutralLossSpecs(object, mzdiff=NULL, mzabs=0, mzppm=10)
```

Arguments

- `object`: xsAnnotate object
- `mzdiff`: neutral loss in Dalton
- `mzabs`: absolut allowed mass difference
- `mzppm`: relative allowed mass difference

Details

The function needs a xsAnnotate object after groupCorr or groupFWHM.

Author(s)

Carsten Kuhl <ckuhl@ipb-halle.de>
getAllPeakEICs

Generate EIC information from raw data

Description
Generate EIC data out of the raw data, according to the peak peaker information.

Usage
getAllPeakEICs(object, index)

Arguments
object The xsAnnotate object
index Sample index vector, with the same length as the number of peaks. Encoding from with sample the peak should be extracted. If all peaks should be generated from the same sample set index = rep(sample index, peak count)

Details
The function extract from the raw data the EIC curves. Therefore all .netcdf, .mzML etc. files must be accessable. It returns a list with two item.

Value
A list with items:

EIC EIC Matrix with rows = number of peaks and columns = maxscans. It contains mostly NA values and only in that part, where a peak had been found, the intensity information.
scantimes Scantimes of each sample

Author(s)
Carsten Kuhl <ckuhl@ipb-halle.de>

#Multiple sample
library(faahKO)
x.s.grp <- group(faahko)

#create xsAnnotate object
xsa <- xsAnnotate(x.s.grp)
#generate pseudospectra
xsa.group <- groupFWHM(xsa)

#calculate correlation
tmp <- getAllPeakEICs(xsa.group,index=rep(1,nrow(xsa.group@groupInfo)))
#extract EIC matrix
EIC.matrix <- tmp$EIC;
```

getAtomCount, compoundQuantiles-method

*The number of atoms of the given element*

Description

Returns the number of atoms the specified element in a compound of the specified mass for the specified quantile level

Usage

```r
## S4 method for signature 'compoundQuantiles'
getAtomCount(object, element, mass, quantile)
```

Arguments

- `object` A compoundQuantiles object
- `element` The element of interest specified by element symbol
- `mass` The mass of the compound specified in atomic units (=dalton)
- `quantile` The quantile level for the number of atoms

Value

The number of atoms

Author(s)

Hendrik Treutler
Examples

cpObj <- compoundQuantiles()

compoundMass <- 503
quantileLow <- 0.05
quantileHigh <- 0.95
element <- "C"

countLow <- getAtomCount(object = cpObj, element = element, mass = compoundMass, quantile = quantileLow)
countHigh <- getAtomCount(object = cpObj, element = element, mass = compoundMass, quantile = quantileHigh)

print(paste("The ",(quantileHigh - quantileLow) * 100,"% confidence interval for the number of atoms of element ",

getIsotopeCluster  
Retrieve the annotated isotopes

Description

Extract all annotated isotope cluster. Returns a list with one element per cluster. A element contains
the charge of the molecule and a peakmatrix with mz and intensity value.

Usage

getIsotopeCluster(object, number=NULL, value="maxo", sampleIndex=NULL)

Arguments

object  xsAnnotate object
number  Set to NULL extract all isotope cluster or to specific chosen ones
value   Which intensity values should be extracted. Allowed values are: maxo, into, intb
sampleIndex  Selection vector with indexes to select from which sample(s) the intensity values
             should be retrieved. If set to NULL the sample is selected, which has been
             chosen for the pseudospectra in the grouping step

Details

This method extract the isotope annotation from a xsAnnotate object. The order of the resulting list
is the same as the one in the peaklist, see getPeaklist.

isolist[[10]] # get IsotopeCluster 10

# multiple sample
library(faahKO)
xs <- group(faahko)
xs <- fillPeaks(xs)
an <- xsAnnotate(xs)
an <- groupFWHM(an)
an <- findIsotopes(an)
isolist <- getIsotopeCluster(an)

# Select from multiple samples

# Select from multiple samples

# Interaction with Rdisop

## Not run:
library(Rdisop)
isotopes.decomposed <- lapply(isolist,function(x) {
decomposeIsotopes(x$peaks[,1],x$peaks[,2],z=x$charge); 
}) # decomposed isotope cluster, filter steps are recommended

## End(Not run)

getIsotopeProportion,compoundQuantiles-method

The proportion of the intensities of two isotope peaks

Description

Returns the proportion of the intensities of isotope1 versus isotope2 for a compound of the given mass for the given quantile level

Usage

## S4 method for signature 'compoundQuantiles'
getIsotopeProportion(object, isotope1, isotope2, mass, quantile)
getPeaklist

Generate the annotated peaklist

Description

Extract all information from an xsAnnotate object. Returns a peaklist with annotated peaks.

Usage

getPeaklist(object, intval="into")

Arguments

object xsAnnotate object
intval Choose intensity values. Allowed values are into, maxo, intb, intf, maxf, area, depending on the feature detection algorithm used.
getpspectra

Details

This function extract the peaktale from an xsAnnotate object, containing three additional columns (isotopes, adducts, pseudospectrum) with represents the annotation results. For a grouped xcmsSet it returns the grouped peaktale.

Author(s)

Carsten Kuhl <ckuhl@ipb-halle.de>

Examples

library(CAMERA)
file <- system.file('mzML/MM14.mzML', package = "CAMERA")
xs <- xcmsSet(file, method="centWave", ppm=30, peakwidth=c(5,10))
an <- xsAnnotate(xs)
an <- groupFWHM(an)
an <- findIsotopes(an)
an <- findAdducts(an,polarity="positive")
peaklist <- getPeaklist(an)

getpspectra(object, grp)

Arguments

object xsAnnotate object
grp index of pseudo-spectra-group

Details

xsAnnotate groups LC/MS Peaklist after there EIC correlation and FWHM. These function extract one or more of these so called "pseudo spectra groups" with include the peaklist with there annotations. The annotation depends on a before called findAdducts() ( and findIsotopes() ). Important: The indices for the isotopes, are those from the whole peaklist. See getPeaklist().

Author(s)

Carsten Kuhl <ckuhl@ipb-halle.de>
Examples

```r
library(CAMERA)
file <- system.file('mzML/MM14.mzML', package = "CAMERA")
xs <- xcmsSet(c(file), method="centWave", ppm=30, peakwidth=c(5,10))
an <- xsAnnotate(xs)
an <- groupFWHM(an)
# For one group
peaklist <- getpspectra(an, 1)
# For two groups
peaklist <- getpspectra(an, c(1,2))
```

---

**getReducedPeaklist**

**Generate reduced peaklist from the annotated peaklist**

Description

Extract information from an xsAnnotate object. Returns a reduced peaklist with annotated peaks. For any putative compound in the pcgroup, all found adducts are pooled into one putative compound per group. Thus, the reduced peaklist only contains one annotated adduct per pcgroup.

Usage

```r
getReducedPeaklist(object, method = "median", intval = "into", default.adduct.info = "first", mzrt.range = FALSE, npeaks.sum = FALSE, cleanup = FALSE)
```

Arguments

- **object**: xsAnnotate object.
- **method**: Choose reduction method. Allowed values are "sum", "median", "maxint", "pca".
- **intval**: Choose intensity values. Allowed values are "into", "maxo", "intb".
- **default.adduct.info**: Choose method to select adduct information. Allowed values are "first", "max-int", "maxpeaks".
- **mzrt.range**: If TRUE, max and min values of mz and rt values of all adducts within a pcgroup are saved (not recommended).
- **npeaks.sum**: If TRUE, the sum of all peaks of all adducts within a pcgroup is saved (not recommended).
- **cleanup**: If TRUE, NA values and negative abundances are being set to zero and constant features (rows) are being removed.
Details

This function extracts a reduced peaktable from an xsAnnotate object. Normally, all adducts are grouped for any putative compounds and saved within the peaklist (see method `getPeaklist`). However, for statistical computation it is sometimes better to only work with putative compounds rather than with all of their adducts. Thus, this function pools all adducts for any putative compound into one putative compound per pcgroup. There are several methods to choose from how this is being done. Selection methods: "sum": The intensities of adducts are summed for each sample. "median" (default): The median intensities of adducts is calculated for each sample. "maxint": Only the adduct with the highest intensities throughout the samples is returned. "pca": A Principal Component Analysis is being performed for the adducts for the samples. and the PC1 values are taken as intensity information. Select mz / rt methods: "first" (default): The mz & rt information of the first adduct are taken. "maxint": The mz & rt information of the adduct that has highest intensities are taken. "maxpeaks": The mz & rt information of the adduct that has the most peaks are taken. In addition, when mzrt.range is TRUE, the min and max values of all mz and rt found in a group are stored within mzmin, mzmax and rttmin and rtmax (not recommended). In addition, when npeaks.sum is TRUE, all peaks within a pcgroup are summed (not recommended).

Author(s)

Kristian Peters <kpeters@ipb-halle.de>

Examples

```r
library(CAMERA)
file <- system.file("mzML/MM14.mzML", package = "CAMERA")
xs <- xcmsSet(file, method="centWave", ppm=30, peakwidth=c(5,10))
an <- xsAnnotate(xs)
an <- groupFWHM(an)
an <- findIsotopes(an)
an <- findAdducts(an,polarity="positive")
peaklist.reduced <- getReducedPeaklist(an)
```

Description

Peak grouping after correlation information into pseudospectrum groups for an xsAnnotate object. Return an xsAnnotate object with grouping information.

Usage

```r
groupCorr(object, cor_eic_th=0.75, pval=0.05, graphMethod="hcs",
calcIso = FALSE, calcCiS = TRUE, calcCaS = FALSE, psg_list=NULL, xraw=NULL,
cor_exp_th=0.75, intval="into", ...)
```
Arguments

- **object**: The xsAnnotate object
- **cor_eic_th**: Correlation threshold for EIC correlation
- **pval**: p-value threshold for testing correlation of significance
- **graphMethod**: Clustering method for resulting correlation graph. See `calcPC` for more details.
- **calcIso**: Include isotope detection information for graph clustering
- **calcCiS**: Calculate correlation inside samples
- **calcCaS**: Calculate correlation across samples
- **psg_list**: Vector of pseudospectra indices. The correlation analysis will be only done for those groups
- **xraw**: Optional xcmsRaw object, which should be used for raw data extraction
- **cor_exp_th**: Threshold for intensity correlations across samples
- **intval**: Selection of the intensity values (such as "into") that should be used in the correlation analysis. See `getPeaklist` for all allowed values.
- ...

Additional parameter

Details

The algorithm calculates different informations for group peaks into so called pseudospectra. This pseudospectra contains peaks, which have a high correlation between each other. So far three different kind of information are available. Correlation of intensities across samples (need more than 3 samples), EIC correlation between peaks inside a sample and additional the information about recognized isotope cluster can be included. After calculation of all these informations, they are combined as edge value into a graph object. A following graph clustering algorithm separate the peaks (nodes in the graph) into the pseudospectra.

# Note: Group 1 and 4 have no subgroups

---

**groupDen**

*Density-Grouping of LC/ESI-MS data*

**Description**

Group peaks of a xsAnnotate object according to peak distributions in chromatographic time into pseudospectra-groups. Works analogous as the group.density method of xcms. Returns xsAnnotate object with pseudospectra informations.

**Usage**

`groupDen(object, bw = 5 , ...)`

**Arguments**

- `object` the xsAnnotate object
- `bw` bandwidth (standard deviation or half width at half maximum) of gaussian smoothing kernel to apply to the peak density chromatogram
- `...` Further Arguments, NYI

**Details**

The grouping strongly depends on the bw parameter. For an UPLC a good starting point is smaller or around 1.

**Value**

Returns a grouped xsAnnotate object.

#With automatic selection
xsa.auto <- xsAnnotate(x)
xsa.grp.auto <- groupDen(xsa.auto)

---

**groupFWHM**

**FWHM-Grouping of LC/ESI-MS data**

Description

Group peaks of a xsAnnotate object according to their retention time into pseudospectra-groups. Uses the peak FWHMs as grouping borders. Returns xsAnnotate object with pseudospectra informations.

Usage

```r
groupFWHM(object, sigma = 6, perfwhm = 0.6, intval = "maxo")
```

Arguments

- **object**: the xsAnnotate object
- **sigma**: the multiplier of the standard deviation
- **perfwhm**: percentage of the width of the FWHM
- **intval**: intensity values for ordering. Allowed values are into, maxo, intb
Details

Every peak that shares a retention time with a selected peak will be part of the group. Same time-point is defined about the Rt_med +/- FWHM * perfwhm. For a single sample xcmsSet, the selection of peaks starts at the most abundant and goes down to the least abundant. With a multiple sample set, the automatic selection uses the most abundant peak as an representative for every feature group, according to the xcms grouping. With the xsAnnotate sample parameter, a sample selection can be defined to use only specific samples. See xsAnnotate-class for further information. The FWHM (full width at half maximum) of a peak is estimated as FWHM = SD * 2.35. For the calculation of the SD, the peak is assumed as normal distributed.

---

**mm14 Extract of marker mixture 14 LC/MS data**

Description

xcmsSet object containing quantitated LC/MS peaks from a marker mixture. The data is a centroided subset from 117-650 m/z and 271-302 seconds with 134 peaks. Positive ionization mode data in mzML file format.

Usage

data(mm14)

Format

The format is:

```
Formal class 'xcmsSet' [package "xcms"] with 8 slots
  @ peaks : num [1:83, 1:11] 117 117 118 119 136 .. ...

Source

References

Data originally reported in "Highly sensitive feature detection for high resolution LC/MS" BMC Bioinformatics; 2008; 9:504.

Description

Batch plot a list of extracted ion chromatograms to the current graphics device.

Arguments

- object: the xsAnnotate object
- xraw: xcmsRaw object underlying the xsAnnotate
- maxlabel: How many m/z labels to print
- sleep: seconds to pause between plotting EICs
- ...: other graphical parameters

Value

None.

Methods

object = "xsAnnotate" plotEICs(object, xraw, pspec=1:length(object@pspectra), maxlabel=0, sleep=0)

Author(s)

Steffen Neumann, <sneumann@ipb-halle.de>

See Also

xsAnnotate-class, png, pdf, postscript.
Description

Plot a pseudospectrum, with the most intense peaks labelled, to the current graphics device.

Usage

plotPsSpectrum(object, pspec=1:length(object@pspectra), log=FALSE, value="into", maxlabel=0, title=NULL, mzrange=numeric(), sleep=0, cexMulti = 1, ...)

Arguments

- `object`: the `xsAnnotate` object
- `pspec`: ID of the pseudospectrum to print
- `log`: Boolean, whether the log(intensity) should be shown
- `value`: Which of a peak’s intensities should be used
- `maxlabel`: How many m/z labels to print
- `title`: Main title of the Plot
- `mzrange`: Which m/z range should plotted
- `sleep`: Time (in seconds) to wait between successive Spectra, if multiple `pspec` are requested.
- `cexMulti`: Cex multiplier for peak labels
- `...`: Additional parameter for function plot

Value

None.

Methods

signature(object = "xsAnnotate") object deriviving from class "xsAnnotate"

Author(s)

Steffen Neumann, <sneumann@ipb-halle.de>

See Also

`xsAnnotate-class`, `png`, `pdf`, `postscript`. 
Description

The package xcms contains several methods for calculating a distance between two sets of peaks. The CAMERA method `psDist` is the generic wrapper to use these methods for processing two pseudospectra from two different `xsAnnotate` objects.

Arguments

- `object1`: a `xsAnnotate` object with pseudospectra
- `object2`: a `xsAnnotate` object with pseudospectra
- `PSpec1`: index of pseudospectrum in object1
- `PSpec2`: index of pseudospectrum in object2
- `method`: method to use for distance calculation. See details.
- `...`: mzabs, mzppm and parameters for the distance function.

Details

Different algorithms can be used by specifying them with the `method` argument. For example to use the "meanMZmatch" approach one would use: `specDist(object1, object2, pspectrum1, pspectrum2, method="meanMZmatch")`. This is also the default.

Further arguments given by `...` are passed through to the function implementing the method.

A character vector of nicknames for all the algorithms which are available is returned by `getOption("BioC")$xcms$specDist.methods`. If the nickname of a method is called "meanMZmatch", the help page for that specific method can be accessed with `?specDist.meanMZmatch`.

Value

- `mzabs`: maximum absolute deviation for two matching peaks
- `mzppm`: relative deviations in ppm for two matching peaks
- `symmetric`: use symmetric pairwise m/z-matches only, or each match

Methods

- `object1 = "xsAnnotate"` specDist(object1, object2, pspectrum1, pspectrum2, method,...)

Author(s)

Joachim Kutzera, <jkutzer@ipb-halle.de>
pspec2metfrag

Export the putative fragments as MetFrag query files

Description
MetFrag is an in-silico metabolite identification system, which aims to putatively identify compounds from fragmentation MS data, especially from tandem-MS, but also in-source fragments might give additional hints on top of the accurate mass of the precursor alone.

Usage

pspec2metfrag(object, pspecidx=NULL, filedir=NULL)
pspec2metfusion(object, pspecidx=NULL, filedir=NULL)

Arguments

object an xsAnnotate object
pspecidx Index of pspectra to export, if NULL then all are exported.
filedir Directory for placement of batch query files

Details
For each spectrum in pspecidx (or all in the xsAnnotate object), for each [M] mass hypothesis, remove all non-fragment peaks (isotopes, clusters, adducts) and pass them to MetFrag and MetFusion batch query files.

Value
Returns a list

Author(s)
Carsten Kuhl <ckuhl@ipb-halle.de>

Examples

library(CAMERA)
file <- system.file('mzML/MM14.mzML', package = "CAMERA");
x <- xcmsSet(file, method="centWave", ppm=30, peakwidth=c(5, 10));
an <- xsAnnotate(xs);
an <- groupFWHM(an);
an <- findIsotopes(an); #optional step
an <- findAdducts(an, polarity="positive")

pspec2metfrag(an, pspecidx=c(1))
ruleSet

Class ruleSet

Description

The class ruleSet is used to read lists of ions, adducts and neutral losses, and compile the dynamic
ruleSet from those. This makes it possible to modify the default rules for certain analytical settings.

Slots

ionlistfile: File of known charged ions, an example is found in CAMERA/lists/ions.csv.
neutrallossfile: File of known neutral losses, an example is found in CAMERA/lists/neutralloss.csv.
neutraladditionfile: File of known adducts, an example is found in CAMERA/lists/lists/neutraladdition.csv.
ionlist: Known charged ions.
neutralloss: Known neutral losses.
neutraladdition: Known adducts.
maxcharge: .
mol: .
nion: .
nloss: .
nadd: .
nh: .
polarity: Polarity of the ruleSet.
rules: data.frame of resulting mass differences, this is the dynamic ruleSet.
lib.loc Path to local Rlibrary

Extends

Class "Versioned", directly.

Methods

Methods implemented for ruleSet

setDefaultLists signature(object = "ruleSet"): Set filenames for the lists shipped with CAM-
ERA.
readLists signature(object = "ruleSet"): Read and parse the lists from the files.
setDefaultParams signature(object = "ruleSet"): Set the default parameters for rule genera-
tion.
setParams signature(object = "ruleSet"): Set the parameters for rule generation.
generateRules signature(object = "ruleSet"): Create the rules in ruleSet@rules.
**Author(s)**

Steffen Neumann and Carsten Kuhl

**Examples**

```r
r <- new("ruleSet");
r2 <- setDefaultLists(r);
r3 <- readLists(r2);
r4 <- setDefaultParams(r3);
r5 <- generateRules(r4)
dim(r5@rules)
```

**xsAnnotate constructor for an provided xcmsSet object**

---

**Description**

This function deals with the construction of an xsAnnotate object. It extracts the peaktble from a provided xcmsSet, which is used for all further analysis. The xcmsSet can be a single sample or multiple sample experiment. Since some functions need the raw data a selection algorithm must be chosen in the case of a multiple sample. CAMERA includes two different strategies: A defined selection of samples (sample = indices of samples) or the default automatic solution (sample = NA). The automatic solution chooses the best sample for a specific group called pseudospectrum, see groupFWHM and groupCorr. It returns a xsAnnotate object, see xsAnnotate-class.

**Usage**

```r
xsAnnotate(xs = NULL, sample = NA, nSlaves = 1, polarity = NULL)
```

**Arguments**

- `xs`: a xcmsSet object
- `sample`: Indices of the group xcmsSet sample, that are used for the EIC correlation step. For automatic selection don’t set a value. For use all samples simply define sample = c(1:n), with n = number of samples.
- `nSlaves`: For parallel mode set nSlaves higher than 1, but not higher than the number of cpu cores.
- `polarity`: Set polarity mode: "positive" or "negative"

**Value**

A xsAnnotate object.

xsAnnotate-class

Examples

library(faahKO)
x <- group(faahko)
xsa <- xsAnnotate(xs, sample=c(1:12))

# With automatic selection
xsa.autoselect <- xsAnnotate(xs)

xsAnnotate-class Class xsAnnotate, a class for annotated peak data

Description

This class transforms a xcmsSet object with peaks from multiple LC/MS or GC/MS samples into a set of annotation results. It contains searching algorithms for isotopes and adducts, peak grouping algorithms to find connected peak, which originate from the same molecule.

Objects from the Class

Objects can be created with the xsAnnotate constructor which include the peaktable from a provided xcmsSet. Objects can also be created by calls of the form new("xsAnnotate", ...).

Slots

annoGrp: Assignment of mass hypotheses to correlation groups
annoID: The assignemnt of peaks to the mass difference rule used
derivativeIons: List with annotation result for every peak
formula: Matrix containing putative sum formula (intended for future use)
isoID: Matrix containing IDs and additional of all annotated isotope peaks
groupInfo: (grouped) Peaktable with "into" values
isotopes: List with annotated isotopid results for every peak
polarity: A single string with the polarity mode of the peaks
pspectra: List contains all pseudospectra with there peak IDs
psSamples: List containing information with sample was sample was selecteted as representative (automatic selection)
ruleset: A dataframe describing the mass difference rules used for the annotation
runParallel: Flag if CAMERA runs in serial or parallel mode
sample: Number of the used xcmsSet sample (beforehand sample selection)
xcmsSet: The embedded xcmsSet
Methods

**groupFWHM** signature(object = "xsAnnotate"): group the peak data after the FWHM of the retention time

**groupCorr** signature(object = "xsAnnotate"): group the peak data after the correlation of the EICs

**findIsotopes** signature(object = "xsAnnotate"): search for possible isotopes in the spectra

**findAdducts** signature(object = "xsAnnotate"): search for possible adducts in the spectra

**plotEICs** signature(object = "xsAnnotate"): plot EICs of pseudospectra

Note

No notes yet.
