Package ‘DominoEffect’

May 2, 2024

Type Package
Title Identification and Annotation of Protein Hotspot Residues
Version 1.24.0
Author Marija Buljan and Peter Blattmann
Maintainer Marija Buljan <marija.buljan.2@gmail.com>,
          Peter Blattmann <peter_blattmann@bluewin.ch>
Description The functions support identification and annotation of hotspot residues in proteins. These are individual amino acids that accumulate mutations at a much higher rate than their surrounding regions.

align_to_unip

Description

This function aligns the Ensembl protein region with a hotspot to the UniProt sequence. The Ensembl region encompasses 15 amino acids where the hotspot is in the middle. If the hotspot was at the protein start or end the region is still 15 amino acids long, but the hotspot position is shifted.

Usage

align_to_unip(ens.seq, uni.seq, ensembl_mut_position)

Arguments

ens.seq          AAString object with the Ensembl protein sequence corresponding to the representative transcript.
uni.seq          AAString with the UniProt sequence for the identifier matching the Ensembl gene name.
ensembl_mut_position
    Numeric vector defining the hotspot position in the Ensembl sequence, i.e. in the ens.seq

Value

Returns a list where the first element is a character vector defining whether there was a significant alignment and the second element provides the hotspot position in the UniProt sequence.

Author(s)

Marija Buljan <buljan@imsb.biol.ethz.ch> Peter Blattmann <blattmann@imsb.biol.ethz.ch>
Examples

```r
library(Biostrings)

ens.seq <- AAString("MDLSALREEVEQVINAMQKILECPICLELIKEPVSTKCDHIFCKFCMLK")
uni.seq <- AAString("MDLSALRVEVEQVINAMQKILECPICLELIKEPVSTKCDHIFCKFCMLA")
ensembl_mut_position <- 25

align_to_unip(ens.seq, uni.seq, ensembl_mut_position)
```

Description

The function calculates boundaries of sequence windows around the mutation. It is possible to define up to two window lengths. If the mutation is close to the start or end of the protein, the region is extended into the other direction to keep the indicated size.

Usage

```r
calculate_boundary(mut_pos_numeric, length_aa, flanking_region)
```

Arguments

- `mut_pos_numeric`: Amino acid position of mutation
- `length_aa`: Length of transcript in amino acids
- `flanking_region`: Vector containing two flanking regions

Value

returns a list with the boundaries for the two regions

Author(s)

Marija Buljan <buljan@imsb.biol.ethz.ch> Peter Blattmann <blattmann@imsb.biol.ethz.ch>

Examples

```r
calculate_boundary(250, 500, c(200, 300))
calculate_boundary(250, 500, 300)
```

DominoEffect

Identification of significant mutation hotspot residues.

Description

The function identifies individual amino acid residues, which accumulate a high fraction of the overall mutation load within a protein. After detecting mutation hotspots, the function obtains UniProt/Swiss-Prot KB functional and structural annotations for the affected protein regions and checks for the sequence agreement.

Usage

```r
DominoEffect(mutation_dataset, gene_data, snp_data,
min_n_muts = 5, MAF_thresh = 0.01,
flanking_region = c(200, 300),
poisson.thr = 0.01, percentage.thr = 0.15,
ratio.thr = 45, approach = "percentage", write_to_file = "NO",
ens_release = "https://feb2023.archive.ensembl.org")
```

Arguments

- `mutation_dataset`: Object containing a table with the mutation data (e.g. TCGA point mutations mapped to protein level).
- `gene_data`: DominoData object containing information about Ensembl gene annotations: gene identifiers and representative transcript cDNA length.
- `snp_data`: Object containing a table with information on population SNPs.
- `min_n_muts`: Numeric vector defining a minimum number of mutations that need to occur at the same residue. Default: 5
- `MAF_thresh`: Numeric vector that defines Minor allele frequency threshold for considering reported mutations as population SNPs.
- `flanking_region`: Numeric vector that defines size of a window around the mutation that will be considered. Up to two window sizes are allowed.
GPo_of_hotspots

poisson.thr  Numeric vector that defines a threshold for the adjusted p-value. Residues with an associated p-value that is lower than the defined value are reported. Default: 0.01

percentage.thr  Number defining the fraction of mutations within the window that need to fall on a single residue in order for it to be classified as a hotspot. Default: 0.15

ratio.thr  Number defining a requirement that a number of mutations on a single residue should exceed what would be expected by chance given a background mutation rate in the window (i.e. the surrounding region). Default: 45

approach  Option to define selection criteria to use percentage.thr or ratio.thr as criterion for finding single residue mutation clusters. Options: "both", "percentage" or "ratio". Default = "percentage"

write_to_file  Option if the identified and annotated hotspots should be written to a file (YES or NO). Default: NO

ens_release  Release of ensembl to be used. Default: https://feb2023.archive.ensembl.org

Value

Results table

Author(s)

Examples

data("SnpData", package = "DominoEffect")
data("TestData", package = "DominoEffect")
data("DominoData", package = "DominoEffect")

hotspot_mutations <- DominoEffect(mutation_dataset = TestData, gene_data = DominoData, snp_data = SnpData)

GPo_of_hotspots  Converts hotspot mutation table into a GPo object

Description

This function converts the genomic information on hotspot mutations into a GPo object.

Usage

GPo_of_hotspots(hotspot_mutations)
**identify_hotspots**

**Arguments**

- **hotspot_mutations**
  
  Data frame with information on hotspot mutations generated by the DominoEffect package.

**Value**

GPo object that contains the genomic information on hotspot mutations.

**Author(s)**

Marija Buljan <buljan@imsb.biol.ethz.ch> Peter Blattmann <blattmann@imsb.biol.ethz.ch>

**Examples**

```r
data("SnpData", package = "DominoEffect")
data("TestData", package = "DominoEffect")
data("DominoData", package = "DominoEffect")

hotspot_mutations <- DominoEffect(mutation_dataset = TestData,
gene_data = DominoData, snp_data = SnpData)
GPo_of_hotspots(hotspot_mutations)
```

---

**Description**

The function identify protein hotspot mutation residues

**Usage**

```r
identify_hotspots(mutation_dataset, gene_data,
snp_data, min_n_muts = 5, MAF_thres = 0.01, flanking_region = c(200, 300),
poisson.thr = 0.01, percentage.thr = 0.15, ratio.thr = 45, approach = "percentage")
```

**Arguments**

- **mutation_dataset**
  
  Object containing a table with the mutation data (e.g. TCGA point mutations mapped to protein level).

- **gene_data**
  
  Data frame or Txdb object containing information about Ensembl gene annotations: gene identifiers and representative transcript cDNA length.

- **snp_data**
  
  Object containing a table or vcf object with information on population SNPs.

- **min_n_muts**
  
  Numeric vector defining a minimum number of mutations that need to occur at the same residue. Default: 5
**MAF_thresh**  Numeric vector that defines Minor allele frequency threshold for considering reported mutations as population SNPs.

**flanking_region**  Numeric vector that defines size of a window around the mutation that will be considered. Up to two window sizes are allowed.

**poisson.thr**  Numeric vector that defines a threshold for the adjusted p-value. Residues with an associated p-value that is lower than the defined value are reported. Default: 0.01

**percentage.thr**  Number defining the fraction of mutations within the window that need to fall on a single residue in order for it to be classified as a hotspot. Default: 0.15

**ratio.thr**  Number defining a requirement that a number of mutations on a single residue should exceed what would be expected by chance given a background mutation rate in the window (i.e. the surrounding region). Default: 45

**approach**  Option to define selection criteria to use percentage.thr or ratio.thr as criterion for finding single residue mutation clusters. Options: "both", "percentage" or "ratio". Default = "percentage"

**Value**

An object containing information on the significant hotspots, associated Gene and protein identifiers, number of mutations, percentage of mutations within defined windows that map to the same residue and associated p-values.

**Author(s)**

Marija Buljan <buljan@imsb.biol.ethz.ch> Peter Blattmann <blattmann@imsb.biol.ethz.ch>

**Examples**

```r
data("SnpData", package = "DominoEffect")
data("TestData", package = "DominoEffect")
data("DominoData", package = "DominoEffect")
hotspot_mutations <- identify_hotspots(mutation_dataset = TestData,
                                        gene_data = DominoData,
                                        snp_data = SnpData)
```

**Description**

This function imports txdb data and converts it into format required for DominoEffect package only extracting the required information from the txdb object.

**Usage**

```r
import_txdb(txdb_object)
```
**map_to_func_elem**

**Arguments**

- txdb_object: TxDB Object, e.g. from makeTxDbFromEnsembl

**Value**

Data frame that can be used in DominoEffect package.

**Author(s)**

Marija Buljan <buljan@imsb.biol.ethz.ch> Peter Blattmann <blattmann@imsb.biol.ethz.ch>

**Examples**

```r
#EnsTxDB <- makeTxDbFromEnsembl(organism="Homo sapiens", release=73,
#server="ensembldb.ensembl.org")
#DominoData <- import_txdb(EnsTxDB)
#head(DominoData)
```

**Description**

This function retrieves Uniprot annotations for the functional elements in the proteins with significant hotspots and overlaps and maps the hotspot residues to these.

**Usage**

```r
map_to_func_elem(hotspot_results, write_to_file = "NO", ens_release = "109")
```

**Arguments**

- hotspot_results: Object containing information about the hotspot residues identified using the function identify_hotspots().
- write_to_file: A character vector defining whether the resulting annotated hotspots should be saved in a file (YES or NO).
- ens_release: A character vector defining whether the default gene annotations are used, i.e. Ensembl release 109, or if the gene_data correspond to a different Ensembl release. For the current Ensembl version this should be set to: ens_release="www.ensembl.org". For the archive versions to the corresponding archive website.

**Value**

Updated results file containing an additional columns with the information on the annotated functional and structural region within which the mutation is mapped.
