Package ‘MGFR’

May 30, 2024

Type Package

Title Marker Gene Finder in RNA-seq data

Version 1.30.0

Author Khadija El Amrani

Maintainer Khadija El Amrani <a.khadija@gmx.de>

Description The package is designed to detect marker genes from RNA-seq data.

Depends R (>= 3.5)

Imports biomaRt, annotate

biocViews ImmunoOncology, Genetics, GeneExpression, RNASeq

License GPL-3

LazyData yes

NeedsCompilation no

**MGFR-package**  
*Marker Gene Finder in RNA-seq data*

**Description**

The package is designed to detect marker genes from RNA-seq data

**Details**

- **Package:** MGFR
- **Type:** Package
- **Version:** 1.9.2
- **License:** GPL-3

**Author(s)**

Khadija El Amrani  
Maintainer: Khadija El Amrani <khadija.el-amrani@charite.de>

**Examples**

```r
data(ref.mat)
res.list <- getMarkerGenes.rnaseq(ref.mat, class.vec=colnames(ref.mat), samples2compare="all", annotate=TRUE, gene.ids.type="ensembl", score.cutoff=1)
names(res.list)
## show the first 20 markers of liver
res.list[["liver_markers"]][1:20]
```

---

**getMarkerGenes.rnaseq**  
*Marker Gene Detection*

**Description**

Function to detect marker genes using normalized RNA-seq data

**Usage**

```r
getMarkerGenes.rnaseq(data.mat, class.vec=colnames(data.mat), samples2compare="all", annotate=FALSE, gene.ids.type="ensembl", score.cutoff=1)
```
getMarkerGenes.rnaseq.html

Marker Gene Detection

Arguments

data.mat RNA-seq gene expression matrix with genes corresponding to rows and samples corresponding to columns.
class.vec A character vector containing the classes of samples (columns) of data.mat in the same order as provided in the matrix.
samples2compare A character vector with the sample names to be compared (e.g. c("liver", "lung", "brain")). By default all samples in the reference matrix are used.
annotate A boolean value. If TRUE the gene symbol and the entrez gene id are shown.
gene.ids.type Type of the used gene identifiers, the following gene identifiers are supported: ensembl, refseq and ucsc gene ids. default is ensembl.
score.cutoff A value in the interval [0,1] to filter the markers according to the specificity score. The default value is 1 (no filtering).

Details

For each marker in the output list, the gene id and the corresponding score are shown. If annotate is TRUE, the gene symbol and the entrez gene id are shown. The score is used to rank the markers according to their specificity. A lower value means a higher specificity.

Value

A list with marker genes associated with each sample type.

Author(s)

Khadija El Amrani <a.khadija@gmx.de>

Examples

data(ref.mat)
res.list <- getMarkerGenes.rnaseq(ref.mat, class.vec = colnames(ref.mat), samples2compare="all", annotate=TRUE, gene.ids.type="ensembl", score.cutoff=1)
names(res.list)
## show the first 20 markers of liver
res.list[["liver_markers"]][1:20]

Marker Gene Detection

Function to detect marker genes using normalized RNA-seq data and show the marker genes in HTML tables with links to various online annotation sources (Ensembl, GenBank and EntrezGene repositories)
Usage

getMarkerGenes.rnaseq.html(data.mat, class.vec=colnames(data.mat), samples2compare="all", gene.ids.type="ensembl", score.cutoff=1, directory = getwd())

Arguments

data.mat    RNA-seq gene expression matrix with genes corresponding to rows and samples corresponding to columns.
class.vec    A character vector containing the classes of samples (columns) of data.mat in the same order as provided in the matrix.
samples2compare    A character vector with the sample names to be compared (e.g. c("liver", "lung", "brain"). By default all samples in the reference matrix are used.
gene.ids.type    Type of the used gene identifiers, the following gene identifiers are supported: ensembl, refseq and ucsc gene ids. default is ensembl.
score.cutoff    A value in the interval [0,1] to filter the markers according to the specificity score. The default value is 1 (no filtering).
directory    Path to the directory where to save the html pages, default is the current working directory.

Details

This function is based on the function htmlpage from the R-package 'annotate'.

Value

This function is used only for the side effect of creating HTML tables.

Author(s)

Khadija El Amrani <a.khadija@gmx.de>

Examples

data(ref.mat)
getMarkerGenes.rnaseq.html(ref.mat, class.vec = colnames(ref.mat), samples2compare="all", gene.ids.type="ensembl")

Internal MGFR Functions

Description

Internal MGFR functions

Details

These are not intended to be called by the user.
**ref.mat**

*RNA-seq gene expression data set*

---

**Description**

RNA-seq gene expression data set derived from 5 tissue types (lung, liver, heart, kidney, and brain) from the ArrayExpress database (E-MTAB-1733). Each tissue type is represented by 3 replicates.

**Usage**

```r
data(ref.mat)
```

**Format**

A matrix with 32431 genes and 15 samples.

**Value**

RNA-seq data matrix

**Examples**

```r
data(ref.mat)
```
