Package ‘MatrixRider’

May 4, 2024

Type Package

Title Obtain total affinity and occupancies for binding site matrices on a given sequence

Version 1.36.0

Date 2015-11-02

Author Elena Grassi

Maintainer Elena Grassi <grassi.e@gmail.com>

Description Calculates a single number for a whole sequence that reflects the propensity of a DNA binding protein to interact with it. The DNA binding protein has to be described with a PFM matrix, for example gotten from Jaspar.

biocViews GeneRegulation, Genetics, MotifAnnotation

License GPL-3

Depends R (>= 3.1.2)

Imports methods, TFBSTools, IRanges, XVector, Biostrings

Suggests RUnit, BiocGenerics, BiocStyle, JASPAR2014

LinkingTo IRanges, XVector, Biostrings, S4Vectors

NeedsCompilation yes

MatrixRider-package  
*Calculate total affinity and occupancies for binding site matrices on a given sequence*

### Description

Calculates a single number for a whole sequence that reflects the propensity of a DNA binding protein to interact with it. The DNA binding protein has to be described with a PFM matrix, for example gotten from Jaspar.

### Author(s)

Elena Grassi <elena.grassi@unito.it>

### Examples

```r
library(JASPAR2014)
library(TFBSTools)
library(Biostrings)
pfm <- getMatrixByID(JASPAR2014,"MA0004.1")
## The following sequence has a single perfect match
## thus it gives the same results with all cutoff values.
sequence <- DNAString("CACGTG")
getSeqOccupancy(sequence, pfm, 0.1)
getSeqOccupancy(sequence, pfm, 1)
```

---

### getSeqOccupancy

*Computes the total affinity or the occupancy at a given cutoff*

### Description

The affinity/occupancy is calculated on the given DNAString for the given PFMatrix (or all the ones in the PFMatrix list given).

### Usage

```r
getSeqOccupancy(sequence, pfm, cutoff)
```

### Arguments

- **sequence**  
  A `DNAString` object with the sequence for which affinity will be computed.

- **pfm**  
  A `PFMatrix` or a `PFMatrixList` object with the matrixes whose affinity will be calculated. The background (\texttt{bg.XMatrix-method}) of the given \texttt{pfm} is used to perform affinity calculations.

- **cutoff**  
  numeric(1); between 0 and 1 (included): 0 corresponds to total affinity (i.e. summing all the affinities) while 1 to summing only values corresponding to the perfect match for a given `PFMatrix`. See vignette for details on how scores are calculated. If \texttt{MatrixRider} is installed, open the vignette with `vignette("MatrixRider")`. 
getSeqOccupancy

**Value**

numeric; the resulting total affinity calculated on the given fasta. If a PFMatrixList has been passed then a named numeric vector with the affinities for all the PFMs. The vignette has all the details on the calculations (such as PFM to PWM conversion and pseudocounts).

**Examples**

```r
library(JASPAR2014)
library(TFBSTools)
library(Biostrings)
pfm <- getMatrixByID(JASPAR2014,"MA0004.1")
## The following sequence has a single perfect match
## thus it gives the same results with all cutoff values.
sequence <- DNAString("CACGTG")
getSeqOccupancy(sequence, pfm, 0.1)
getSeqOccupancy(sequence, pfm, 1)

pfm2 <- getMatrixByID(JASPAR2014,"MA0005.1")
pfms <- PFMatrixList(pfm, pfm2)
names(pfms) <- c(name(pfm), name(pfm2))
## This calculates total affinity for both the PFMatrixes.
getSeqOccupancy(sequence, pfms, 0)
```
