Package ‘SeqArray’

March 2, 2024

Type Package

Title Data Management of Large-Scale Whole-Genome Sequence Variant Calls

Version 1.42.2

Date 2024-02-16

Depends R (>= 3.5.0), gdsfmt (>= 1.31.1)

Imports methods, parallel, IRanges, GenomicRanges, GenomeInfoDb, Biostrings, S4Vectors

LinkingTo gdsfmt

Suggests Biobase, BiocGenerics, BiocParallel, RUnit, Rcpp, SNPRelate, digest, crayon, knitr, markdown, rmarkdown, Rsamtools, VariantAnnotation

Description Data management of large-scale whole-genome sequencing variant calls with thousands of individuals: genotypic data (e.g., SNVs, indels and structural variation calls) and annotations in SeqArray GDS files are stored in an array-oriented and compressed manner, with efficient data access using the R programming language.

Description

Data management of large-scale whole-genome sequencing variants.

Details

As the cost of DNA sequencing rapidly decreases, whole-genome sequencing (WGS) is generating data at an unprecedented rate. Scientists are being challenged to manage data sets that are terabyte-sized, contain diverse types of data and complex data relationships. Data analyses of WGS requires a general file format for storing genetic variants including single nucleotide variations (SNVs), insertions and deletions (indels) and structural variants. The variant call format (VCF) is a generic and flexible format for storing DNA polymorphisms developed for the 1000 Genomes Project that is the standard WGS format in use today. VCF is a textual format usually stored in compressed files that supports rich annotations and relatively efficient data retrieval. However, VCF files are large and the computational burden associated with all data retrieval from text files can be significant for a large WGS study with thousands of samples.

To provide an efficient alternative to VCF for WGS data, we developed a new data format and accompanying Bioconductor package, “SeqArray”. Key features of SeqArray are efficient storage including multiple high compression options, data retrieval by variant or sample subsets, support for parallel access and computing, and C++ integration in the R programming environment. The SeqArray package provides R functions for efficient block-wise computations, and enables scientists to develop custom R scripts for exploratory data analysis.

summary(af)

# close the GDS file
seqClose(f)
KG_P1_SampData  

*Simulated sample data for 1000 Genomes Phase 1*

**Description**

An AnnotatedDataFrame with columns `sample.id`, `sex`, `age`, and `phenotype`, where the identifiers in `sample.id` match those in the SeqArray file.

**Usage**

```r
KG_P1_SampData
```

**Value**

An AnnotatedDataFrame

---

seqAddValue  

*Add values to a GDS File*

**Description**

Add or modify the values in a GDS file with hash code

**Usage**

```r
seqAddValue(gdsfile, varnm, val, desp=character(), replace=FALSE, compress="LZMA_RA", packed=TRUE, packed.idx=TRUE, verbose=TRUE, verbose.attr=TRUE)
```

**Arguments**

- `gdsfile` character for file name, or a `SeqVarGDSClass` object
- `varnm` the variable name, e.g., "sample.id", "variant.id", "chromosome", "annotation/info/NEW_VARIABLE"
- `val` the R value can be integers, real numbers, characters, factor, logical, raw variable, `data.frame` or a list; a list of vectors is used for variable-length annotation data; or `NULL` for adding a new folder
- `desp` variable description
- `replace` if `TRUE`, replace the existing variable silently if possible
- `compress` the compression method can be "" (no compression), see `add.gdsn`
- `packed` `TRUE`, pack data if there is any missing value
- `packed.idx` `TRUE`, store the index variable using integers with the fewest bits if possible
- `verbose` if `TRUE`, show information
- `verbose.attr` if `TRUE`, show attribute information in a GDS node
seqAddValue

Value

Return none.

Examples

# the file of GDS
gds.fn <- seqExampleFileName("gds")
file.copy(gds.fn, "tmp.gds", overwrite=TRUE)

# display
(f <- seqOpen("tmp.gds", readonly=FALSE))
show(index.gdsn(f, "sample.id"))
seqAddValue(f, "sample.id", 1:90, replace=TRUE)
show(index.gdsn(f, "sample.id"))

show(index.gdsn(f, "chromosome"))
v <- seqGetData(f, "chromosome")
seqAddValue(f, "chromosome", paste0("chr", v), replace=TRUE)
show(index.gdsn(f, "chromosome"))
table(seqGetData(f, "chromosome"))

# annotation info
seqAddValue(f, "annotation/info/folder", NULL) # add a new folder
seqAddValue(f, "annotation/info/folder/val", 1:1348, "random number")
seqAddValue(f, "annotation/info/folder/packed", c(rep(2L, 1000), rep(NA, 348)))
seqAddValue(f, "annotation/info/newff",
    data.frame(x=1:1348, y=rep("s", 1348), stringsAsFactors=FALSE),
    desp=c("integer numbers", "character"))

# variable-length annotation info data
v <- lapply(1:1348, function(x) as.character(x))
v[[1]] <- 1:10
seqAddValue(f, "annotation/info/folder/val1", v)
head(seqGetData(f, "annotation/info/folder/val1", .tolist=TRUE))

# sample annotation
seqAddValue(f, "sample.annotation", data.frame(ii=1:90, y=rep("A", 90)), replace=TRUE)
seqAddValue(f, "sample.annotation/float", (1:90)/90)

# close the GDS file
seqClose(f)
seqAlleleFreq  

Get Allele Frequencies or Counts

Description

Calculates the allele frequencies or counts for reference or minor alleles.

Usage

```
seqAlleleFreq(gdsfile, ref.allele=0L, minor=FALSE, parallel=seqGetParallel(), verbose=FALSE)
seqAlleleCount(gdsfile, ref.allele=0L, minor=FALSE, parallel=seqGetParallel(), verbose=FALSE)
seqGetAF_AC_Missing(gdsfile, minor=FALSE, parallel=seqGetParallel(), verbose=FALSE)
```

Arguments

- `gdsfile`  
a `SeqVarGDSClass` object
- `ref.allele`  
NULL, a single numeric value, a numeric vector or a character vector; see Value
- `minor`  
if TRUE, return minor allele frequency/count
- `parallel`  
FALSE (serial processing), TRUE (multicore processing), numeric value or other value; `parallel` is passed to the argument `cl` in `seqParallel`, see `seqParallel` for more details.
- `verbose`  
if TRUE, show progress information

Details

If the gds node 'genotype/data' (integer genotypes) is not available, the node 'annotation/format/DS' (numeric genotype dosages for alternative alleles) will be used to calculate allele frequencies. At a site, it assumes 'annotation/format/DS' stores the dosage of the 1st alternative allele in the 1st column, 2nd alt. allele in the 2nd column if it is multi-allelic, and so on.

Value

If `ref.allele=NULL`, the function returns a list of allele frequencies/cents according to all allele per site. If `ref.allele` is a single numeric value (like `0L`), it returns a numeric/integer vector for the specified allele (0L for the reference allele, 1L for the first alternative allele, etc). If `ref.allele` is a numeric vector, `ref.allele` specifies each allele per site. If `ref.allele` is a character vector, `ref.allele` specifies the desired allele for each site (e.g. ancestral allele for the derived allele frequency/count).
seqAlleleFreq

seqGetAF_AC_Missing() returns data.frame(af, ac, miss) for allele frequencies, allele counts and missing rates. It is faster than calling seqAlleleFreq(), seqAlleleCount() and seqMissing sequentially.

Author(s)

Xiuwen Zheng

seqMissing, seqNumAllele, seqParallel, seqGetParallel

Examples

```r
# the GDS file
gds.fn <- seqExampleFileName("gds")

# display
f <- seqOpen(gds.fn)

# return a list
head(seqAlleleFreq(f, NULL, verbose=TRUE))

# return a numeric vector
summary(seqAlleleFreq(f, 0L, verbose=TRUE))

# return a numeric vector
summary(seqAlleleFreq(f, 0L, minor=TRUE, verbose=TRUE))

# return a numeric vector, AA is ancestral allele
AA <- seqGetData(f, "annotation/info/AA", .padNA=TRUE)
summary(seqAlleleFreq(f, AA))
summary(seqAlleleFreq(f, AA, minor=TRUE))

# allele counts
head(seqAlleleCount(f, NULL, verbose=TRUE))
head(seqAlleleCount(f, 0L, verbose=TRUE))
head(seqAlleleCount(f, 0L, minor=TRUE, verbose=TRUE))
head(seqAlleleCount(f, AA, verbose=TRUE))
head(seqAlleleCount(f, AA, minor=TRUE, verbose=TRUE))

# allele frequencies, allele counts and missing proportions
v <- seqGetAF_AC_Missing(f, minor=TRUE)
head(v)

# close the GDS file
seqClose(f)
```
seqApply

Apply Functions Over Array Margins

Description

Returns a vector or list of values obtained by applying a function to margins of genotypes and annotations.

Usage

seqApply(gdsfile, var.name, FUN, margin=c("by.variant", "by.sample"),
as.is=c("none", "list", "integer", "double", "character", "logical", "raw"),
var.index=c("none", "relative", "absolute"), parallel=FALSE,
.useraw=FALSE, .progress=FALSE, .list_dup=TRUE, ...)

Arguments

gdsfile a SeqVarGDSClass object
var.name the variable name(s), see details
FUN the function to be applied
margin giving the dimension which the function will be applied over; margin="by.variant" by default
as.is returned value: a list, an integer vector, etc; return nothing by default as.is="none";
as.is can be a connection object, or a GDS node gdsn.class object; if "unlist" is used, produces a vector which contains all the atomic components, via unlist(..., recursive=FALSE)
var.index if "none" (by default), call FUN(x, ...) without variable index; if "relative" or "absolute", add an argument to the user-defined function FUN like FUN(index, x, ...) where index is an index of variant starting from 1 if margin = "by.variant": "relative" for indexing in the selection defined by seqSetFilter, "absolute" for indexing with respect to all data
parallel FALSE (serial processing), TRUE (multicore processing), numeric value or other value; parallel is passed to the argument cl in seqParallel, see seqParallel for more details.
.useraw TRUE, force to use RAW instead of INTEGER for genotypes and dosages; FALSE, use INTEGER; NA, use RAW for small numbers instead of INTEGER if possible, it is needed to detect data type (RAW or INTEGER) in the user-defined function; for genotypes, 0xFF is missing value if RAW is used
.progress if TRUE, show progress information
.list_dup internal use only
...
optional arguments to FUN
Details

The variable name should be "sample.id", "variant.id", "position", "chromosome", "allele", "genotype", "annotation/id", "annotation/qual", "annotation/filter", "annotation/info/VARIABLE_NAME", or "annotation/format/VARIABLE_NAME".

"@genotype", "annotation/info/@VARIABLE_NAME" or "annotation/format/@VARIABLE_NAME" are used to obtain the index associated with these variables.

"$dosage" is also allowed for the dosages of reference allele (integer: 0, 1, 2 and NA for diploid genotypes).

"$dosage_alt" returns a RAW/INTEGER matrix for the dosages of alternative allele without distinguishing different alternative alleles.

"$num_allele" returns an integer vector with the numbers of distinct alleles.

"$ref" returns a character vector of reference alleles

"$alt" returns a character vector of alternative alleles (delimited by comma)

"$chrom_pos" returns characters with the combination of chromosome and position, e.g., "1:1272721".

"$chrom_pos_allele" returns characters with the combination of chromosome, position and alleles, e.g., "1:1272721_A_G" (i.e., chr:position_REF_ALT).

The algorithm is highly optimized by blocking the computations to exploit the high-speed memory instead of disk.

Value

A vector, a list of values or none.

**seqAsVCF**

**VariantAnnotation objects**

---

### Description
Create a VCF-class object

### Usage

```
seqAsVCF(x, chr.prefix="", info=NULL, geno=NULL)
```

### Arguments

- **x**
  - a SeqVarGDSClass object
- **chr.prefix**
  - prefix to add to seqlevels
- **info**
  - which INFO fields to return
- **geno**
  - which GENO fields to return
**Details**

Coerces a SeqVarGDSClass object to a VCF-class object. Row names correspond to the variant.id. info and geno specify the 'INFO' and 'GENO' (FORMAT) fields to return, respectively. If not specified, all fields are returned; if 'NA' no fields are returned. Use seqSetFilter prior to calling seqAsVCF to specify samples and variants to return.

The **VariantAnnotation** package should be loaded to explore this object.

**Value**

A CollapsedVCF object.

**Author(s)**

Stephanie Gogarten, Xiuwen Zheng

**See Also**

VCF-class

**Examples**

```r
gds <- seqOpen(seqExampleFileName("gds"))

## Not run:
library(VariantAnnotation)
sseqAsVCF(gds)

## End(Not run)

seqClose(gds)
```

---

**seqBED2GDS**  
*Conversion between PLINK BED and SeqArray GDS*

**Description**

Conversion between PLINK BED format and SeqArray GDS format.

**Usage**

```r
seqBED2GDS(bed.fn, fam.fn, bim.fn, out.gdsfn, compress.geno="LZMA_RA",
          compress.annotation="LZMA_RA", chr.conv=TRUE, include.pheno=TRUE,
          optimize=TRUE, digest=TRUE, parallel=FALSE, verbose=TRUE)
seqGDS2BED(gdsfile, out.fn, write.rsid=c("auto", "annot_id", "chr_pos_ref_alt"),
           multi.row=FALSE, verbose=TRUE)
```
seqBED2GDS

Arguments

- **bed.fn**: the file name of binary file, genotype information
- **fam.fn**: the file name of first six columns of ".ped"
- **bim.fn**: the file name of extended MAP file: two extra columns = allele names
- **gdsfile**: character (a GDS file name), or a `SeqVarGDSClass` object
- **out.gdsfn**: the file name, output a file of SeqArray format
- **out.fn**: the file name of PLINK binary format without extended names
- **compress.geno**: the compression method for "genotype"; optional values are defined in the function `add.gdsn`
- **compress.annotation**: the compression method for the GDS variables, except "genotype"; optional values are defined in the function `add.gdsn`
- **chr.conv**: if TRUE, convert numeric chromosome codes 23 to X, 24 to Y, 25 to XY, and 26 to MT
- **include.pheno**: if TRUE, add 'family', 'father', 'mother', 'sex' and 'phenotype' in the FAM file to the output GDS file; FALSE for no phenotype; or a character vector to specify which of the family, father, mother, sex and phenotype variables to be added
- **optimize**: if TRUE, optimize the access efficiency by calling `cleanup.gds`
- **digest**: a logical value (TRUE/FALSE) or a character ("md5", "sha1", "sha256", "sha384" or "sha512"); add hash codes to the GDS file if TRUE or a digest algorithm is specified
- **parallel**: FALSE (serial processing), TRUE (parallel processing), a numeric value indicating the number of cores, or a cluster object for parallel processing; parallel is passed to the argument cl in `seqParallel`, see `seqParallel` for more details
- **write.rsid**: "annot_id": use the node "annotation/id" for the variant IDs; "chr_pos_ref_alt": use the format "chrom_position_ref_alt"; "auto": use "annotation/id" for the variant IDs if it is not a blank string or ".", otherwise use "chrom_position_ref_alt"
- **multi.row**: if TRUE, a multiallelic site is converted to multiple rows in PLINK bim and bed files
- **verbose**: if TRUE, show information

Value

Return the file name of SeqArray file with an absolute path.

seqBlockApply Apply Functions Over Array Margins via Blocking

Description

Returns a vector or list of values obtained by applying a function to margins of genotypes and annotations via blocking.

Usage

seqBlockApply(gdsfile, var.name, FUN, margin=c("by.variant"),
as.is=c("none", "list", "unlist"), var.index=c("none", "relative", "absolute"),
bsize=1024L, parallel=FALSE, .useraw=FALSE, .padNA=TRUE, .tolist=FALSE,
.progress=FALSE, ...)

Arguments

gdsfile a SeqVarGDSClass object
var.name the variable name(s), see details
FUN the function to be applied
margin giving the dimension which the function will be applied over
as.is returned value: a list, an integer vector, etc; return nothing by default as.is="none";
as.is can be a connection object, or a GDS node gdsn.class object; if "unlist" is used, produces a vector which contains all the atomic components, via unlist(..., recursive=FALSE)
var.index  if "none" (by default), call FUN(x, ...) without variable index; if "relative" or "absolute", add an argument to the user-defined function FUN like FUN(index, x, ...) where index is an index of variant starting from 1 if margin="by.variant": "relative" for indexing in the selection defined by seqSetFilter, "absolute" for indexing with respect to all data

bsize    block size

parallel    FALSE (serial processing), TRUE (multicore processing), numeric value or other value; parallel is passed to the argument cl in seqParallel, see seqParallel for more details.

useraw    TRUE, force to use RAW instead of INTEGER for genotypes and dosages; FALSE, use INTEGER; NA, use RAW instead of INTEGER if possible; for genotypes, 0xFF is missing value if RAW is used

padNA    TRUE, pad a variable-length vector with NA if the number of data points for each variant is not greater than 1

tolist    if TRUE, return a list of vectors instead of the structure list(length, data) for variable-length data

.progress    if TRUE, show progress information

...    optional arguments to FUN

Details

The variable name should be "sample.id", "variant.id", "position", "chromosome", "allele", "genotype", "annotation/id", "annotation/qual", "annotation/filter", "annotation/info/VARIABLE_NAME", or "annotation/format/VARIABLE_NAME".

"@genotype", "annotation/info/@VARIABLE_NAME" or "annotation/format/@VARIABLE_NAME" are used to obtain the index associated with these variables.

"$dosage" is also allowed for the dosages of reference allele (integer: 0, 1, 2 and NA for diploid genotypes).

"$dosage_alt" returns a RAW/INTEGER matrix for the dosages of alternative allele without distinguishing different alternative alleles.

"$dosage_sp" returns a sparse matrix (dgCMatrix) for the dosages of alternative allele without distinguishing different alternative alleles.

"$num_allele" returns an integer vector with the numbers of distinct alleles.

"$ref" returns a character vector of reference alleles

"$alt" returns a character vector of alternative alleles (delimited by comma)

"$chrom_pos" returns characters with the combination of chromosome and position, e.g., "1:1272721".

"$chrom_pos_allele" returns characters with the combination of chromosome, position and alleles, e.g., "1:1272721_A_G" (i.e., chr:position_REF_ALT).

"$variant_index" returns the indices of selected variants starting from 1, and "$sample_index" returns the indices of selected samples starting from 1.

The algorithm is highly optimized by blocking the computations to exploit the high-speed memory instead of disk.
Value

A vector, a list of values or none.

seqCheck

Data Integrity Checking

Description

Performs data integrity on a SeqArray GDS file.
Usage

seqCheck(gdsfile, verbose=TRUE)

Arguments

gdsfile a SeqVarGDSClass object, or a file name
verbose if TRUE, display information

Value

A list of the following components:

- **hash**: a data.frame for hash checking, including algo for digest algorithms and ok for the checking states
- **dimension**: a data.frame for checking the dimension of each variable, including ok for the checking states and info for the error messages

Author(s)

Xiuwen Zheng

Examples

# the GDS file
(gds.fn <- seqExampleFileName("gds"))

seqCheck(gds.fn)

---

**seqClose-methods**

*Close the SeqArray GDS File*

Description

Closes a SeqArray GDS file which is open.

Usage

```r
## S4 method for signature 'gds.class'
seqClose(object)
## S4 method for signature 'SeqVarGDSClass'
seqClose(object)
```

Arguments

- **object**: a SeqArray object
Details

If object is

- **gds.class**, close a general GDS file
- **SeqVarGDSClass**, close the sequence GDS file.

Value

None.

Author(s)

Xiuwen Zheng

See Also

seqOpen

---

**seqDelete**  
*Delete GDS Variables*

Description

Deletes variables in the SeqArray GDS file.

Usage

```r
seqDelete(gdsfile, info.var=character(), fmt.var=character(),
         samp.var=character(), verbose=TRUE)
```

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>gdsfile</td>
<td>a <strong>SeqVarGDSClass</strong> object</td>
</tr>
<tr>
<td>info.var</td>
<td>the variables in the INFO field, i.e., &quot;annotation/info/VARIABLE_NAME&quot;</td>
</tr>
<tr>
<td>fmt.var</td>
<td>the variables in the FORMAT field, i.e., &quot;annotation/format/VARIABLE_NAME&quot;</td>
</tr>
<tr>
<td>samp.var</td>
<td>the variables in the sample annotation field, i.e., &quot;sample.annotation/VARIABLE_NAME&quot;</td>
</tr>
<tr>
<td>verbose</td>
<td>if TRUE, show information</td>
</tr>
</tbody>
</table>

Value

None.

Xiuwen Zheng
seqDigest

See Also
seqOpen, seqClose

Examples

# the file of GDS
gds.fn <- seqExampleFileName("gds")
file.copy(gds.fn, "tmp.gds", overwrite=TRUE)

# display
(f <- seqOpen("tmp.gds", FALSE))

seqDelete(f, info.var=c("HM2", "AA"), fmt.var="DP")
f

# close the GDS file
seqClose(f)

# clean up the fragments, reduce the file size
cleanup.gds("tmp.gds")

# remove the temporary file
unlink("tmp.gds", force=TRUE)

seqDigest
Hash function digests

Description
Create hash function digests for all or a subset of data

Usage
seqDigest(gdsfile, varname, algo=c("md5"), verbose=FALSE)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>gdsfile</td>
<td>a SeqVarGDSClass object</td>
</tr>
<tr>
<td>varname</td>
<td>the variable name(s), see details</td>
</tr>
<tr>
<td>algo</td>
<td>the digest hash algorithm: &quot;md5&quot;</td>
</tr>
<tr>
<td>verbose</td>
<td>if TRUE, show progress information</td>
</tr>
</tbody>
</table>

Details
The variable name should be "sample.id", "variant.id", "position", "chromosome", "allele", "annotation/id", "annotation/qual", "annotation/filter", "annotation/info/VARIABLE_NAME", or "annotation/format/VARIABLE_NAME".

Users can define a subset of data via seqSetFilter and create a hash digest for the subset only.
Value
A hash character.

Author(s)
Xiuwen Zheng

See Also
seqSetFilter, seqApply

Examples

```r
# the GDS file
(gds.fn <- seqExampleFileName("gds"))

# display
f <- seqOpen(gds.fn)
seqDigest(f, "genotype")
seqDigest(f, "annotation/filter")
seqDigest(f, "annotation/format/DP")

# close the GDS file
seqClose(f)
```

Description
Create a new empty GDS file.

Usage

```r
seqEmptyFile(outfn, sample.id=character(), verbose=TRUE)
```

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>outfn</td>
<td>the output file name for a GDS file</td>
</tr>
<tr>
<td>sample.id</td>
<td>a list of sample IDs</td>
</tr>
<tr>
<td>verbose</td>
<td>if TRUE, show information</td>
</tr>
</tbody>
</table>

Value
None.
seqExampleFileName

Author(s)
 Xiuwen Zheng

See Also
 seqVCF2GDS

Examples

```
seqEmptyFile("tmp.gds")

(f <- seqOpen("tmp.gds"))
seqClose(f)

# remove the temporary file
unlink("tmp.gds", force=TRUE)
```

Description

The example files of VCF and GDS format.

Usage

```
seqExampleFileName(type=c("gds", "vcf", "KG_Phase1"))
```

Arguments

type 

either "gds" (by default) or 'vcf'

Value

Return the path of a VCF file in the package if type="vcf", or the path of a GDS file if type="gds". If type="KG_Phase1", return the path of GDS file on Chromosome 22 of the 1000 Genomes Phase 1 project.

Author(s)
 Xiuwen Zheng

Examples

```
seqExampleFileName("gds")
seqExampleFileName("vcf")
seqExampleFileName("KG_Phase1")
```
seqExport  

Export to a GDS File

Description

Exports to a GDS file with selected samples and variants, which are defined by seqSetFilter().

Usage

seqExport(gdsfile, out.fn, info.var=NULL, fmt.var=NULL, samp.var=NULL, optimize=TRUE, digest=TRUE, verbose=TRUE)

Arguments

gdsfile  a SeqVarGDSClass object
out.fn  the file name of output GDS file
info.var  characters, the variable name(s) in the INFO field for import; or NULL for all variables
fmt.var  characters, the variable name(s) in the FORMAT field for import; or NULL for all variables
samp.var  characters, the variable name(s) in the folder "sample.annotation"
optimize  if TRUE, optimize the access efficiency by calling cleanup.gds
digest  a logical value (TRUE/FALSE) or a character ("md5", "sha1", "sha256", "sha384" or "sha512"); add md5 hash codes to the GDS file if TRUE or a digest algorithm is specified
verbose  if TRUE, show information

Value

Return the file name of GDS format with an absolute path.

Author(s)

Xiuwen Zheng

seqVCF2GDS
Examples

# open the GDS file
(gds.fn <- seqExampleFileName("gds"))
(f <- seqOpen(gds.fn))

# get 'sample.id'
head(samp.id <- seqGetData(f, "sample.id"))

# get 'variant.id'
head(variant.id <- seqGetData(f, "variant.id"))

set.seed(100)
# set sample and variant filters
seqSetFilter(f, sample.id=samp.id[c(2,4,6,8,10,12,14,16)])
seqSetFilter(f, variant.id=sample(variant.id, 100))

# export
seqExport(f, "tmp.gds")
seqExport(f, "tmp.gds", info.var=character())
seqExport(f, "tmp.gds", fmt.var=character())
seqExport(f, "tmp.gds", samp.var=character())

# show file
(f1 <- seqOpen("tmp.gds"); seqClose(f1))

# close
seqClose(f)

# delete the temporary file
unlink("tmp.gds")

seqGDS2SNP

Convert to a SNP GDS File

Description

Converts a SeqArray GDS file to a SNP GDS file.

Usage

seqGDS2SNP(gdsfile, out.gdsfn, dosage=FALSE, compress.geno="LZMA_RA",
compress.annotation="LZMA_RA", ds.type=c("packedreal16", "float", "double"),
optimize=TRUE, verbose=TRUE)
Arguments

- **gdsfile**: character (a GDS file name), or a `SeqVarGDSClass` object
- **out.gdsfn**: the file name, output a file of VCF format
- **dosage**: a logical value, or characters for the variable name of dosage in the SeqArray file; if FALSE exports genotypes, otherwise exports dosages
- **compress.geno**: the compression method for "genotype"; optional values are defined in the function `add.gdsn`
- **compress.annotation**: the compression method for the GDS variables, except "genotype"; optional values are defined in the function `add.gdsn`
- **ds.type**: applicable when import dosages, the data type for storing dosages; see `add.gdsn`; `ds.type="packedreal16"` by default
- **optimize**: if TRUE, optimize the access efficiency by calling `cleanup.gds`
- **verbose**: if TRUE, show information

Details

`seqSetFilter` can be used to define a subset of data for the conversion.

Value

Return the file name of VCF file with an absolute path.

Author(s)

Xiuwen Zheng

See Also

`seqSNP2GDS`, `seqVCF2GDS`, `seqGDS2VCF`

Examples

```r
# the GDS file
gds.fn <- seqExampleFileName("gds")
seqGDS2SNP(gds.fn, "tmp.gds")

# delete the temporary file
unlink("tmp.gds")
```
seqGDS2VCF

Convert to a VCF File

Description

Converts a SeqArray GDS file to a Variant Call Format (VCF) file.

Usage

```r
seqGDS2VCF(gdsfile, vcf.fn, info.var=NULL, fmt.var=NULL, chr_prefix="",
use_Rsamtools=TRUE, verbose=TRUE)
```

Arguments

- `gdsfile`: a `SeqVarGDSClass` object
- `vcf.fn`: the file name, output a file of VCF format; or a `connection` object
- `info.var`: a list of variable names in the INFO field, or NULL for using all variables; character(0) for no variable in the INFO field
- `fmt.var`: a list of variable names in the FORMAT field, or NULL for using all variables; character(0) for no variable in the FORMAT field
- `chr_prefix`: the prefix of chromosome, e.g., "chr"; no prefix by default
- `use_Rsamtools`: TRUE for loading the Rsamtools package, see details
- `verbose`: if TRUE, show information

Details

`seqSetFilter` can be used to define a subset of data for the export.

If the filename extension is "gz" or "bgz", the gzip compression algorithm will be used to compress the output data. When the Rsamtools package is installed and `use_Rsamtools=TRUE`, the exported file utilizes the bgzf format (bgzip, a variant of gzip format) allowing for fast indexing. `bzfile` or `xzfile` will be used, if the filename extension is "bz" or "xz".

Value

Return the file name of VCF file with an absolute path.

seqGet2bGeno | Get packed genotypes

Description

Gets a RAW matrix of genotypes in a packed 2-bit format.

Usage

seqGet2bGeno(gdsfile, samp_by_var=TRUE, ext_nbyte=0L, verbose=FALSE)

Arguments

gdsfile | a SeqVarGDSClass object
samp_by_var | if TRUE, return a sample-by-variant matrix; otherwise, return a variant-by-sample matrix
ext_nbyte | additional ext_nbyte row(s) with missing genotypes
verbose | if TRUE, show progress information

Details

If samp_by_var=TRUE, the function returns a sample-by-variant RAW matrix (nrow = ceiling(# of samples / 4)); otherwise, it returns a variant-by-sample RAW matrix (nrow = ceiling(# of variants / 4)). The RAW matrix consists of a 2-bit array, with 0, 1 and 2 for dosage, and 3 for missing genotype.

Value

Return a RAW matrix.

**seqGetData**

*Get Data*

**Description**

Gets data from a SeqArray GDS file.

**Usage**

```r
seqGetData(gdsfile, var.name, .useraw=FALSE, .padNA=TRUE, .tolist=FALSE, .envir=NULL)
```

**Arguments**

- `gdsfile` a `SeqVarGDSClass` object
- `var.name` a variable name or a character vector, see details
- `.useraw` TRUE, force to use RAW instead of INTEGER for genotypes and dosages; FALSE, use INTEGER; NA, use RAW for small numbers instead of INTEGER if possible; 0xFF is missing value if RAW is used
- `.padNA` TRUE, pad a variable-length vector with NA if the number of data points for each variant is not greater than 1
- `.tolist` if TRUE, return a list of vectors instead of the structure list(length, data) for variable-length data
- `.envir` NULL, an environment object, a list or a data.frame

**Details**

The variable name should be "sample.id", "variant.id", "position", "chromosome", "allele", "genotype", "annotation/id", "annotation/qual", "annotation/filter", "annotation/info/VARIABLE_NAME", or "annotation/format/VARIABLE_NAME".

"@genotype", "annotation/info/@VARIABLE_NAME" or "annotation/format/@VARIABLE_NAME" are used to obtain the index associated with these variables.

"$dosage" is also allowed for the dosages of reference allele (integer: 0, 1, 2 and NA for diploid genotypes).
"$dosage_alt" returns a RAW/INTEGER matrix for the dosages of alternative allele without distinguishing different alternative alleles.

"$dosage_sp" returns a sparse matrix (dgCMatrix) for the dosages of alternative allele without distinguishing different alternative alleles.

"$num_allele" returns an integer vector with the numbers of distinct alleles.

"$ref" returns a character vector of reference alleles. "$alt" returns a character vector of alternative alleles (delimited by comma).

"$chrom_pos" returns characters with the combination of chromosome and position, e.g., "1:1272721".
"$chrom_pos2" is similar to "$chrom_pos", except the suffix "_1" is added to the first duplicate following the variant, "_2" is added to the second duplicate, and so on. "$chrom_pos_allele" returns characters with the combination of chromosome, position and alleles, e.g., "1:1272721_A_G" (i.e., chr:position_REF_ALT).

"$variant_index" returns the indices of selected variants starting from 1, and "$sample_index" returns the indices of selected samples starting from 1.

"$:VAR" return the variable "VAR" from .envir according to the selected variants.

Value
Return vectors, matrices or lists (with length and data components) with a class name SeqVarDataList.

Author(s)
Xiuwen Zheng

# close the GDS file
seqClose(f)
```

---

## seqGetFilter

*Get the Filter of GDS File*

### Description

Gets the filter of samples and variants.

### Usage

```r
seqGetFilter(gdsfile, .useraw=FALSE)
```

### Arguments

- **gdsfile**  
  a `SeqVarGDSClass` object  
- **.useraw**  
  returns logical vectors if FALSE, and returns raw vectors if TRUE

### Value

Return a list:

- **sample.sel**  
  a logical/raw vector indicating selected samples  
- **variant.sel**  
  a logical/raw vector indicating selected variants

### Author(s)

Xiuwen Zheng

### See Also

- `seqSetFilter`

### Examples

```r
# the GDS file
(gds.fn <- seqExampleFileName("gds"))

# display
(f <- seqOpen(gds.fn))

# get 'sample.id'
```
(samp.id <- seqGetData(f, "sample.id"))
# "NA06984" "NA06985" "NA06986" ...

# get 'variant.id'
head(variant.id <- seqGetData(f, "variant.id"))

# set sample and variant filters
seqSetFilter(f, sample.id=samp.id[c(2,4,6,8,10)])
set.seed(100)
seqSetFilter(f, variant.id=sample(variant.id, 10))

# get filter
z <- seqGetFilter(f)

# the number of selected samples
sum(z$sample.sel)
# the number of selected variants
sum(z$variant.sel)

z <- seqGetFilter(f, .useraw=TRUE)
head(z$sample.sel)
head(z$variant.sel)

# close the GDS file
seqClose(f)

---

**seqMerge**

Merge Multiple SeqArray GDS Files

**Description**

Merges multiple SeqArray GDS files.

**Usage**

```r
seqMerge(gds.fn, out.fn, storage.option="LZMA_RA", info.var=NULL, fmt.var=NULL, samp.var=NULL, optimize=TRUE, digest=TRUE, geno.pad=TRUE, verbose=TRUE)
```

**Arguments**

- `gds.fn` the file names of multiple GDS files
- `out.fn` the output file name
- `storage.option` specify the storage and compression option, "ZIP_RA" (seqStorageOption("ZIP_RA")); or "LZMA_RA" to use LZMA compression algorithm with higher compression ratio (by default)
seqMerge

| info.var | characters, the variable name(s) in the INFO field; NULL for all variables, or character() excludes all INFO variables |
| fmt.var | characters, the variable name(s) in the FORMAT field; NULL for all variables, or character() excludes all FORMAT variables |
| samp.var | characters, the variable name(s) in 'sample.annotation'; or NULL for all variables |
| optimize | if TRUE, optimize the access efficiency by calling cleanup.gds |
| digest | a logical value (TRUE/FALSE) or a character ("md5", "sha1", "sha256", "sha384" or "sha512"); add md5 hash codes to the GDS file if TRUE or a digest algorithm is specified |
| geno.pad | TRUE, pad a 2-bit genotype array in bytes to avoid recompressing genotypes if possible |
| verbose | if TRUE, show information |

**Details**

The function merges multiple SeqArray GDS files. Users can specify the compression method and level for the new GDS file. If gds.fn contains one file, users can change the storage type to create a new file.

**WARNING:** the functionality of seqMerge() is limited.

**Value**

Return the file name of GDS format with an absolute path.

**Author(s)**

Xiuwen Zheng

**See Also**

seqVCF2GDS, seqExport

**Examples**

```r
# the VCF file
vcf.fn <- seqExampleFileName("vcf")

# the number of variants
total.count <- seqVCF_Header(vcf.fn, getnum=TRUE)$num.variant

split.cnt <- 5
start <- integer(split.cnt)
count <- integer(split.cnt)

s <- (total.count+1) / split.cnt
st <- 1L
for (i in 1:split.cnt)
{
  z <- round(s * i)
```
seqMissing

Missing genotype percentage

Description

Calculates the missing rates per variant or per sample.

Usage

seqMissing(gdsfile, per.variant=TRUE, parallel=seqGetParallel(), verbose=FALSE)

Arguments

gdsfile a SeqVarGDSClass object
seqMissing

- **per.variant**: missing rate per variant if TRUE, missing rate per sample if FALSE, or calculating missing rates for variants and samples if NA
- **parallel**: FALSE (serial processing), TRUE (multicore processing), numeric value or other value; parallel is passed to the argument cl in seqParallel, see seqParallel for more details.
- **verbose**: if TRUE, show progress information

**Details**

If the gds node 'genotype/data' (integer genotypes) is not available, the node 'annotation/format/DS' (numeric genotype dosages for alternative alleles) will be used to calculate allele frequencies. At a site, it assumes 'annotation/format/DS' stores the dosage of the 1st alternative allele in the 1st column, 2nd alt. allele in the 2nd column if it is multi-allelic, and so on.

**Value**

A vector of missing rates, or a list(variant, sample) for both variants and samples.

**Author(s)**

Xiuwen Zheng

**See Also**

seqAlleleFreq, seqNumAllele, seqParallel, seqGetParallel

**Examples**

```r
# the GDS file
(gds.fn <- seqExampleFileName("gds"))

# display
(f <- seqOpen(gds.fn))

summary(m1 <- seqMissing(f, TRUE, verbose=TRUE))
summary(m2 <- seqMissing(f, FALSE, verbose=TRUE))

str(m <- seqMissing(f, NA, verbose=TRUE))
identical(m1, m$variant) # should be TRUE
identical(m2, m$sample) # should be TRUE

# close the GDS file
seqClose(f)
```
seqNewVarData

Description

Gets a variable-length data object.

Usage

seqNewVarData(len, data)
seqListVarData(obj)

Arguments

len       a non-negative vector for variable lengths
data      a vector of data according to `len`
obj       a SeqVarDataList object

Details

seqNewVarData() creates a SeqVarDataList object for variable-length data, and seqListVarData() converts the SeqVarDataList object to a list. seqGetData() returns a SeqVarDataList object for variable-length data; seqAddValue() can add a SeqVarDataList object to a GDS file.

Value

Return a SeqVarDataList object.

Author(s)

Xiuwen Zheng

See Also

seqGetData, seqAddValue

Examples

```r
obj <- seqNewVarData(c(1,2,1,0,2), c("A", "B", "B", "C", "E", "E"))
obj

seqListVarData(obj)
```
seqNumAllele

seqNumAllele | Number of alleles

Description

Returns the numbers of alleles for each site.

Usage

seqNumAllele(gdsfile)

Arguments

gdsfile a SeqVarGDSClass object

Value

The numbers of alleles for each site.

Author(s)

Xiuwen Zheng

See Also

seqAlleleFreq, seqMissing

Examples

# the GDS file
(gds.fn <- seqExampleFileName("gds"))

# display
f <- seqOpen(gds.fn)

table(seqNumAllele(f))

# close the GDS file
seqClose(f)
seqOpen  
Open a SeqArray GDS File

Description

Opens a SeqArray GDS file.

Usage

seqOpen(gds.fn, readonly=TRUE, allow.duplicate=FALSE)

Arguments

gds.fn  the file name  
readonly whether read-only or not  
allow.duplicate  if TRUE, it is allowed to open a GDS file with read-only mode when it has been opened in the same R session

Details

It is strongly suggested to call seqOpen instead of openfn.gds, since seqOpen will perform internal checking for data integrality.

Value

Return an object of class SeqVarGDSClass inherited from gds.class.

seqClose, seqGetData, seqApply

Examples

# the GDS file
(gds.fn <- seqExampleFileName("gds"))

# open the GDS file
gdsfile <- seqOpen(gds.fn)

# display the contents of the GDS file in a hierarchical structure
gdsfile

# close the GDS file
seqClose(gdsfile)
seqOptimize

**seqOptimize**

*Optimize the Storage of Data Array*

**Description**

Transpose data array or matrix for possibly higher-speed access.

**Usage**

```r
dependent <- seqOptimize(gdsfn, target=c("chromosome", "by.sample"), format.var=TRUE, cleanup=TRUE, verbose=TRUE)
```

**Arguments**

- `gdsfn`: the file name of GDS
- `target`: "chromosome", "by.sample"; see details
- `format.var`: a character vector for selected variable names, or TRUE for all variables, according to "annotation/format"
- `cleanup`: call `link{cleanup.gds}` if TRUE
- `verbose`: if TRUE, show information

**Details**

"chromosome": adding or updating two additional nodes '@chrom_rle_val' and '@chrom_rle_len' for faster chromosome indexing, requiring SeqArray>=v1.20.0.

"by.sample": optimizing GDS file for `seqApply(..., margin="by.sample")`. Warning: optimizing GDS file for reading data by sample may increase file size by up to 2X as genotype data and all format data are duplicated.

**Value**

None.

**Author(s)**

Xiuwen Zheng

**See Also**

`seqGetData`, `seqApply`
Examples

# the file name of VCF
(vcf.fn <- seqExampleFileName("vcf"))
# or vcf.fn <- "C:/YourFolder/Your_VCF_File.vcf"

# convert
seqVCF2GDS(vcf.fn, "tmp.gds", storage.option="ZIP_RA")

# prepare data for the SeqVarTools package
seqOptimize("tmp.gds", target="by.sample")

# list the structure of GDS variables
(f <- seqOpen("tmp.gds"))
# close
seqClose(f)

# delete the temporary file
unlink("tmp.gds")

seqParallel

Apply Functions in Parallel

Description

Applies a user-defined function in parallel.

Usage

seqParallel(cl=seqGetParallel(), gdsfile, FUN,
  split=if(gdsfile) == "by.variant", "by.sample", "none"), .combine="unlist",
  .selection.flag=FALSE, .initialize=NULL, .finalize=NULL, .initparam=NULL,
  .balancing=FALSE, .bl_size=10000L, .bl_progress=FALSE, ...)

seqParApply(cl=seqGetParallel(), x, FUN, load.balancing=TRUE, ...)

Arguments

cl  NULL or FALSE: serial processing; TRUE: multicore processing (the maximum
     number of cores minor one); a numeric value: the number of cores to be used; a
     cluster object for parallel processing, created by the functions in the package
     parallel, like makeCluster; a BiocParallelParam object from the BiocPar-
     allel package. See details

gdsfile  a SeqVarGDSClass object, or NULL

FUN  the function to be applied, should be like FUN(gdsfile, ...) if gdsfile is
     given, or FUN(...) if gdsfile=NULL

split  split the dataset by variant or sample according to multiple processes, or "none"
     for no split; split="by.variant" by default
**seqParallel**

**.combine**

Define a function for combining results from different processes; by default, "unlist" is used, to produce a vector which contains all the atomic components, via unlist(..., recursive=FALSE); "list", return a list of results created by child processes; "none", no return; or a function with one or two arguments, like "+".

**.selection.flag**

TRUE – passes a logical vector of selection to the second argument of FUN(gdsfile, selection, ...)

**.initialize**

A user-defined function for initializing workers, should have two arguments (process_id, param)

**.finalize**

A user-defined function for finalizing workers, should have two arguments (process_id, param)

**.initparam**

Parameters passed to .initialize and .initialize

**.balancing**

Load balancing if TRUE

**.bl_size**

Chuck size, the increment for load balancing, 10000 for variants; only applicable if .balancing=TRUE

**.bl_progress**

If TRUE and .balancing=TRUE, show progress information

**x**

A vector (atomic or list), passed to FUN

**load.balancing**

If TRUE, call clusterApplyLB instead of clusterApply

**...**

Optional arguments to FUN

**Details**

When cl is TRUE or a numeric value, forking techniques are used to create a new child process as a copy of the current R process, see ?parallel::mcfork. However, forking is not available on Windows, and makeCluster is called to make a cluster which will be deallocated after calling FUN. It is strongly suggested to use seqParallel together with seqParallelSetup. seqParallelSetup could work around the problem of forking on Windows, without allocating clusters frequently.

The user-defined function could use two predefined variables SeqArray:::process_count and SeqArray:::process_index to tell the total number of cluster nodes and which cluster node being used.

seqParallel(, gdsfile=NULL, FUN=..., split="none") could be used to setup multiple streams of pseudo-random numbers, and see nextRNGStream or nextRNGSubStream in the package parallel.

**Value**

A vector or list of values.

**Author(s)**

Xiuwen Zheng

**See Also**

seqSetFilter, seqGetData, seqApply, seqParallelSetup, seqGetParallel
Examples

```r
library(parallel)

# choose an appropriate cluster size or number of cores
seqParallelSetup(2)

# the GDS file
(gds.fn <- seqExampleFileName("gds"))

# display
(gdsfile <- seqOpen(gds.fn))

# the uniprocessor version
afreq1 <- seqParallel(, gdsfile, FUN = function(f) {
  seqApply(f, "genotype", as.is="double",
            FUN=function(x) mean(x==0, na.rm=TRUE))
}, split="by.variant")

length(afreq1)
summary(afreq1)

# run in parallel
afreq2 <- seqParallel(, gdsfile, FUN = function(f) {
  seqApply(f, "genotype", as.is="double",
            FUN=function(x) mean(x==0, na.rm=TRUE))
}, split="by.variant")

length(afreq2)
summary(afreq2)

# check
length(afreq1) # 1348
all(afreq1 == afreq2)

# check -- variant splits

# -- variant splits
seqParallel(, gdsfile, FUN = function(f) {
  v <- seqGetFilter(f)
  sum(v$variant.sel)
}, split="by.variant")
# [1] 674 674

# check -- variant splits

# -- variant splits
seqParallel(, NULL, FUN = function() {
  paste(SeqArray:::process_index, SeqArray:::process_count, sep=" / ")
}, split="none")
```
seqParallelSetup

Description

Setups a parallel environment in R for the current session.

Usage

seqParallelSetup(cluster=TRUE, verbose=TRUE)
seqGetParallel()
seqMulticoreSetup(num, type=c("psock", "fork"), verbose=TRUE)

Arguments

cluster NULL or FALSE: serial processing; TRUE: parallel processing with the maximum number of cores minor one; a numeric value: the number of cores to be used; a cluster object for parallel processing, created by the functions in the package parallel, like makeCluster. See details

num the maximum number of cores used for the user-defined multicore setting; FALSE, NA or any value less than 2, to disable the multicore cluster

type either PSOCK or Fork cluster setup for the multicore setting, the resulting parallel cluster will be used if ‘parallel’ is a number greater than one in associated functions

verbose if TRUE, show information
seqRecompress

Recompress the GDS file

Description

Recompress the SeqArray GDS file.

Details

When cl is TRUE or a numeric value, forking techniques are used to create a new child process as a copy of the current R process, see `?parallel::mcfork`. However, forking is not available on Windows, so multiple processes created by `makeCluster` are used instead. The R environment option `seqarray.parallel` will be set according to the value of `cluster`. Using `seqParallelSetup(FALSE)` removes the registered cluster, as does stopping the registered cluster.

Value

`seqParallelSetup()` has no return, and `seqGetParallel()` returns `getOption("seqarray.parallel", FALSE)`.

`seqParallel`, `seqApply`

Examples

```r
library(parallel)

seqParallelSetup(2L)

# the GDS file
(gds.fn <- seqExampleFileName("gds"))

# display
(f <- seqOpen(gds.fn))

# run in parallel
summary(seqMissing(f))

# close the GDS file
seqClose(f)

seqParallelSetup(FALSE)
```
seqRecompress

Usage

seqRecompress(gds.fn, compress=c("ZIP", "LZ4", "LZMA", "Ultra", "UltraMax", "none"),
               exclude=character(), optimize=TRUE, verbose=TRUE)

Arguments

gds.fn                  the file name of SeqArray file
compress                the compression method, compress="ZIP" by default
exclude                a list of GDS nodes to be excluded, see details
optimize                if TRUE, optimize the access efficiency by calling cleanup.gds
verbose                 if TRUE, show information

Details

This function requires gdsfmt (>= v1.17.2). seqVCF2GDS usually takes lots of memory when
the compression method "LZMA_RA.max", "Ultra" or "UltraMax" is specified. So users could
call seqVCF2GDS(, storage.option="ZIP_RA") first, and then recompress the GDS file with a
higher compression option, e.g., "UltraMax". seqRecompress() takes much less memory than
seqVCF2GDS(), since it recompresses data in a GDS node each time.

"UltraMax" might be not better than "Ultra", and its behavior is similar to xz -9 --extreme:
use a slower variant of the selected compression preset level (-9) to hopefully get a little bit better
compression ratio, but with bad luck this can also make it worse.

ls.gdsn(gdsfile, include.hidden=TRUE, recursive=TRUE) returns a list of GDS nodes to be
re-compressed, and users can specify the excluded nodes in the argument exclude.

Value

None.

seqVCF2GDS, seqStorageOption

Examples

gds.fn <- seqExampleFileName("gds")
file.copy(gds.fn, "tmp.gds")
seqRecompress("tmp.gds", "LZMA")
unlink("tmp.gds")
**seqResetVariantID**  
*Reset Variant ID in SeqArray GDS Files*

**Description**
Resets the variant IDs in multiple SeqArray GDS files.

**Usage**
```
seqResetVariantID(gds.fn, set=NULL, digest=TRUE, optimize=TRUE, verbose=TRUE)
```

**Arguments**
- `gds.fn`: a character vector of multiple GDS file names
- `set`: NULL or a logical vector; NULL for resetting all files, or TRUE for resetting variant.id for that GDS file
- `digest`: a logical value, if TRUE, add a md5 hash code
- `optimize`: if TRUE, optimize the access efficiency by calling `cleanup.gds`
- `verbose`: if TRUE, show information

**Details**
The variant IDs will be replaced by the numbers in sequential order and adjacent to each file. The variant ID starts from 1 in the first GDS file.

**Value**
None.

Xiuwen Zheng

**See Also**
`seqVCF2GDS`

**Examples**
```
fn <- seqExampleFileName("gds")

file.copy(fn, "tmp1.gds", overwrite=TRUE)
file.copy(fn, "tmp2.gds", overwrite=TRUE)

gds.fn <- c("tmp1.gds", "tmp2.gds")
seqResetVariantID(gds.fn)
```
seqSetFilter-methods

Sets a filter to sample and/or variant.

Usage

## S4 method for signature 'SeqVarGDSClass,ANY'
seqSetFilter(object, variant.sel,  
    sample.sel=NULL, variant.id=NULL, sample.id=NULL,  
    action=c("set", "intersect", "push", "push+set", "push+intersect", "pop"),  
    ret.idx=FALSE, warn=TRUE, verbose=TRUE)

## S4 method for signature 'SeqVarGDSClass,GRanges'
seqSetFilter(object, variant.sel,  
    rm.txt="chr", intersect=FALSE, verbose=TRUE)

## S4 method for signature 'SeqVarGDSClass,GRangesList'
seqSetFilter(object, variant.sel,  
    rm.txt="chr", intersect=FALSE, verbose=TRUE)

## S4 method for signature 'SeqVarGDSClass,IRanges'
seqSetFilter(object, variant.sel,  
    chr, intersect=FALSE, verbose=TRUE)

seqResetFilter(object, sample=TRUE, variant=TRUE, verbose=TRUE)
seqSetFilterChrom(object, include=NULL, is.num=NA, from.bp=NULL, to.bp=NULL,  
    intersect=FALSE, verbose=TRUE)
seqSetFilterPos(object, chr, pos, ref=NULL, alt=NULL, intersect=FALSE,  
    multi.pos=TRUE, ret.idx=FALSE, verbose=TRUE)
seqSetFilterAnnotID(object, id, ret.idx=FALSE, verbose=TRUE)
seqFilterPush(object)  # store the current filter
seqFilterPop(object)  # restore the last filter

Arguments

object  a SeqVarGDSClass object
variant.sel: a logical/raw/index vector indicating the selected variants; **GRanges**, a GRanges object for the genomic locations; **GRangesList**, a GRangesList object for storing a collection of GRanges objects; **IRanges**, a IRanges object for storing a collection of range objects.

sample.sel: a logical/raw/index vector indicating the selected samples

variant.id: ID of selected variants

sample.id: ID of selected samples

action: "set" – set the current filter via sample.id, variant.id, samp.sel or variant.sel; "intersect" – set the current filter to the intersection of selected samples and/or variants; "push" – push the current filter to the stack, and it could be recovered by "pop" later; no change on the current filter; "push+set" – push the current filter to the stack, and changes the current filter via sample.id, variant.id, samp.sel or variant.sel; "push+intersect" – push the current filter to the stack, and set the current filter to the intersection of selected samples and/or variants; "pop" – pop up the last filter.

ret.idx: if TRUE, return the index in the output array according to the order of 'sample.id', 'sample.sel', 'variant.id' or 'variant.sel'

rm.txt: a character, the characters will be removed from seqnames(variant.sel)

chr: a vector of character for chromosome coding

pos: a vector of numeric values for genome coordinate

sample: logical, if TRUE, include all samples

variant: logical, if TRUE, include all variants

include: NULL, or a vector of characters for specified chromosome(s)

is.num: a logical variable: TRUE, chromosome code is numeric; FALSE, chromosome is not numeric; is.num=TRUE is usually used to exclude non-autosomes

from.bp: NULL, no limit; a numeric vector, the lower bound of position

to.bp: NULL, no limit; a numeric vector, the upper bound of position

intersect: if FALSE, the candidate samples/variants for selection are all samples/variants (by default); if TRUE, the candidate samples/variants are from the selected samples/variants defined via the previous call

ref: the reference alleles

alt: the alternative alleles

multi.pos: FALSE, use the first matched position; TRUE, allow multiple variants at the same position

id: a character vector for RS IDs (stored in "annotation/id")

warn: if TRUE, show a warning when the input sample.sel or variant.sel is not ordered as the GDS file or there is any duplicate

verbose: if TRUE, show information
Details

seqResetFilter(file) is equivalent to seqSetFilter(file), where the selection arguments in seqSetFilter are NULL.

If from.bp and to.bp has values, they should be equal-size as include. A trio of include, from.bp and to.bp indicates a region on human genomes. NA in from.bp is treated as 0, and NA in to.bp is treated as the maximum of integer (2^31 - 1).

Value

If ret.idx=TRUE, seqSetFilter() returns a list with two components sample_idx and variant_idx to indicate the indices of the output array according to the input 'sample.id', 'sample.sel', 'variant.id' or 'variant.sel'; if ret.idx=TRUE, seqSetFilterAnnotID() return an index vector; otherwise no return.

seqClose(f)

seqSetFilterCond

Set a Filter to Variant with Allele Count/Freq

Description

Sets a filter to variant with specified allele count/frequency and missing rate.

Usage

seqSetFilterCond(gdsfile, maf=NaN, mac=1L, missing.rate=NaN,
                 parallel=seqGetParallel(), .progress=FALSE, verbose=TRUE)

Arguments

- **gdsfile**: a `SeqVarGDSClass` object
- **maf**: minimum minor reference allele frequency, or a range of MAF maf[1] <= ... < maf[2]
- **mac**: minimum minor reference allele count, or a range of MAC mac[1] <= ... < mac[2]
- **missing.rate**: maximum missing genotype rate
- **.progress**: if TRUE, show progress information
seqSNP2GDS

Convert SNPRelate Format to SeqArray Format

Description

Converts a SNP GDS file to a SeqArray GDS file.

Usage

seqSNP2GDS(gds.fn, out.fn, storage.option="LZMA_RA", major.ref=TRUE, ds.type=c("packedreal16", "float", "double"), optimize=TRUE, digest=TRUE, verbose=TRUE)
Arguments

gds.fn the file name of SNP format
out.fn the file name, output a file of SeqArray format
storage.option specify the storage and compression options, "LZMA_RA" to use LZMA compression algorithm with higher compression ratio compared to "ZIP_RA"
major.ref if TRUE, use the major allele as a reference allele; otherwise, use A allele in SNP GDS file as a reference allele
ds.type applicable when import dosages, the data type for storing dosages; see `add.gdsn`;
    ds.type="packedreal16" by default
optimize if TRUE, optimize the access efficiency by calling `cleanup.gds`
digest a logical value (TRUE/FALSE) or a character ("md5", "sha1", "sha256", "sha384" or "sha512"); add hash codes to the GDS file if TRUE or a digest algorithm is specified
verbose if TRUE, show information

Value

Return the file name of SeqArray file with an absolute path. If the input file is genotype dosage, the dosage matrix is stored in the node annotation/format/DS with the estimated dosage of alternative alleles. Any value less than 0 or greater than 2 will be replaced by NaN.

Examples

library(SNPRelate)

# the GDS file
gds.fn <- snpgdsExampleFileName()

seqSNP2GDS(gds.fn, "tmp.gds")

seqSummary("tmp.gds")

# remove the temporary file
unlink("tmp.gds", force=TRUE)
seqStorageOption

Storage and Compression Options

Description

Storage and compression options for GDS import and merging.

Usage

Arguments

- compression: the default compression level ("ZIP_RA"), see add.gdsn for the description of compression methods
- mode: a character vector, specifying storage type for corresponding variable, e.g., c(‘annotation/info/HM’="int16", ‘annotation/format/PL’="int")
- float.mode: specify the storage mode for read numbers, e.g., "float32", "float64", "packedreal16"; the additional parameters can follow by colon, like "packedreal16:scale=0.0001"
- geno.compress: NULL for the default value, or the compression method for genotypic data
- info.compress: NULL for the default value, or the compression method for data sets stored in the INFO field (i.e., "annotation/info")
- format.compress: NULL for the default value, or the compression method for data sets stored in the FORMAT field (i.e., "annotation/format")
- index.compress: NULL for the default value, or the compression method for data index variables (e.g., "annotation/info/@HM")
- ... other specified storage compression for corresponding variable, e.g., ‘annotation/info/HP’="ZIP_MAX"

Details

The compression modes "Ultra" and "UltraMax" attempt to maximize the compression ratio using gigabyte-sized or even terabyte-sized virtual memory, according to "LZMA_RA.ultra" and "LZMA_RA.ultra_max" in compression.gdsn. These features require gdsfmt (>=v1.16.0). "Ultra" and "UltraMax" may not increase the compression ratio much compared with "LZMA_RA.max", and these options are designed for the users who want to exhaust the computational resources.

Value

Return a list with a class name "SeqGDSStorageClass", contains the compression algorithm for each data type.

---

seqSummary Summarize a SeqArray GDS File

Description

Gets the summary of SeqArray GDS file.

Usage

seqSummary(gdsfile, varname=NULL, check=c("default", "none", "full"),
    verbose=TRUE)
Arguments

gdsfile a `SeqVarGDSClass` object, or a file name

varname if NULL, check the whole GDS file; or a character specifying variable name, and return a description of that variable. See details

check should be one of "default", "none", "full"; check="default" by default

verbose if TRUE, display information

Details

If check="default", the function performs regular checking, like variable dimensions. If check="full", it performs more checking, e.g., unique sample id, unique variant id, whether genotypic data are in a valid range or not.

Value

If varname=NULL, the function returns a list:

- `filename` the file name
- `version` the version of SeqArray format
- `reference` genome reference, a character vector (0-length for undefined)
- `ploidy` the number of sets of chromosomes
- `num.sample` the total number of samples
- `num.variant` the total number of variants
- `allele` allele information, see `seqSummary(gdsfile, "allele")`
- `annot_qual` the total number of "annotation/qual" if check="none", or a summary object including min, max, median, mean
- `filter` filter information, see `seqSummary(gdsfile, "annotation/filter")`
- `info` a `data.frame` of INFO field: ID, Number, Type, Description, Source and Version
- `format` a `data.frame` of FORMAT field: ID, Number, Type and Description
- `sample.annot` a `data.frame` of sample annotation with ID, Type and Description

- `seqSummary(gdsfile, "genotype", check="none", verbose=FALSE)` returns a list with components:
  - `dim` an integer vector: ploidy, # of samples, # of variants
  - `seldim` an integer vector: ploidy, # of selected samples, # of selected variants

- `seqSummary(gdsfile, "allele")` returns a `data.frame` with ID and descriptions (check="none"), or a list with components:
  - `value` a `data.frame` with ID and Description
  - `table` cross tabulation for the number of alleles per site
seqSummary

— seqSummary(gdsfile, "$alt") returns a data.frame with ID and Description for describing the alternative alleles.
— seqSummary(gdsfile, "annotation/filter") or seqSummary(gdsfile, "$filter") returns a data.frame with ID and description (check="none"), or a list with components: value (a data.frame with ID and Description), table (cross tabulation for the variable 'filter').
— seqSummary(gdsfile, "annotation/info") or seqSummary(gdsfile, "$info") returns a data.frame describing the variables in the folder "annotation/info" with ID, Number, Type, Description, Source and Version.
— seqSummary(gdsfile, "annotation/format") returns a data.frame describing the variables in the folder "annotation/format" with ID, Number, Type and Description.
— seqSummary(gdsfile, "sample.annotation") returns a data.frame describing sample annotation with ID, Type and Description.
— seqSummary(gdsfile, "$reference") returns the genome reference if it is defined (a 0-length character vector if undefined).
— seqSummary(gdsfile, "$contig") returns the contig information, a data.frame including ID.
— seqSummary(gdsfile, "$format") returns a data.frame describing VCF FORMAT header with ID, Number, Type and Description. The first row is used for genotypes.
— seqSummary(gdsfile, "$digest") returns a data.frame with the full names of GDS variables, digest codes and validation (FALSE/TRUE).

seqSystem

Get the parameters in the GDS system

Description

Get a list of parameters in the GDS system

Usage

seqSystem()

Value

A list including

num.logical.core
the number of logical cores

compiler.flag
SIMD instructions supported by the compiler

options
list all options associated with SeqArray GDS format or packages

Author(s)

Xiuwen Zheng
**Description**

Transpose data array or matrix for possibly higher-speed access.

**Usage**

```r
seqTranspose(gdsfile, var.name, compress=NULL, digest=TRUE, verbose=TRUE)
```

**Arguments**

- `gdsfile` a `SeqVarGDSClass` object
- `var.name` the variable name with ‘/’ as a separator
- `compress` the compression option used in `add_gdsn`; or determine automatically if NULL
- `digest` a logical value (TRUE/FALSE) or a character ("md5", "sha1", "sha256", "sha384" or "sha512"); add md5 hash codes to the GDS file if TRUE or a digest algorithm is specified
- `verbose` if TRUE, show information

**Details**

It is designed for possibly higher-speed access. More details will be provided in the future version.

**Value**

None.

`seqGetData`, `seqApply`
Examples

```r
# the VCF file
(vcf.fn <- seqExampleFileName("vcf"))

# convert
seqVCF2GDS(vcf.fn, "tmp.gds", storage.option="ZIP_RA")

# list the structure of GDS variables
f <- seqOpen("tmp.gds", FALSE)
f

seqTranspose(f, "genotype/data")
f

# the original array
index.gdsn(f, "genotype/data")
# the transposed array
index.gdsn(f, "genotype/~data")

# close
seqClose(f)

# delete the temporary file
unlink("tmp.gds")
```

seqUnitApply  

Apply Function Over Variant Units

Description

Applies a user-defined function to each variant unit.

Usage

```r
seqUnitApply(gdsfile, units, var.name, FUN, as.is=c("none", "list", "unlist"),
  parallel=FALSE, ..., .bl_size=256L, .progress=FALSE, .useraw=FALSE,
  .padNA=TRUE, .tolist=FALSE, .envir=NULL)
```

Arguments

- `gdsfile`: a `SeqVarGDSClass` object
- `units`: a list of units of selected variants, with S3 class `SeqUnitListClass`
- `var.name`: the variable name(s), see details
- `FUN`: the function to be applied
- `as.is`: returned value: a list, an integer vector, etc; return nothing by default `as.is="none"`; `as.is` can be a `connection` object, or a GDS node `gdsn.class` object; if "unlist" is used, produces a vector which contains all the atomic components, via `unlist(..., recursive=FALSE)`
**seqUnitApply**

| parallel | FALSE (serial processing), TRUE (multicore processing), numeric value or other value; parallel is passed to the argument cl in seqParallel, see seqParallel for more details. |
| .bl_size | chuck size, the increment for load balancing, 256 for units |
| .progress | if TRUE, show progress information |
| .useraw | TRUE, force to use RAW instead of INTEGER for genotypes and dosages; FALSE, use INTEGER; NA, use RAW instead of INTEGER if possible; for genotypes, 0xFF is missing value if RAW is used |
| .padNA | TRUE, pad a variable-length vector with NA if the number of data points for each variant is not greater than 1 |
| .tolist | if TRUE, return a list of vectors instead of the structure list(length, data) for variable-length data |
| .envir | NULL, an environment object, or a list/data.frame |

**Details**

The variable name should be "sample.id", "variant.id", "position", "chromosome", "allele", "genotype", "annotation/id", "annotation/qual", "annotation/filter", "annotation/info/VARIABLE_NAME", or "annotation/format/VARIABLE_NAME".

"@genotype", "annotation/info/@VARIABLE_NAME" or "annotation/format/@VARIABLE_NAME" are used to obtain the index associated with these variables.

"$dosage" is also allowed for the dosages of reference allele (integer: 0, 1, 2 and NA for diploid genotypes).

"$dosage_alt" returns a RAW/INTEGER matrix for the dosages of alternative allele without distinguishing different alternative alleles.

"$dosage_sp" returns a sparse matrix (dgCMatrix) for the dosages of alternative allele without distinguishing different alternative alleles.

"$num_allele" returns an integer vector with the numbers of distinct alleles.

"$ref" returns a character vector of reference alleles

"$alt" returns a character vector of alternative alleles (delimited by comma)

"$chrom_pos" returns characters with the combination of chromosome and position, e.g., "1:1272721".

"$chrom_pos_allele" returns characters with the combination of chromosome, position and alleles, e.g., "1:1272721_A_G" (i.e., chr:position_REF_ALT).

"$variant_index" returns the indices of selected variants starting from 1, and "$sample_index" returns the indices of selected samples starting from 1.

**Value**

A vector, a list of values or none.

Examples

# open the GDS file
gdsfile <- seqOpen(seqExampleFileName("gds"))

# variant units via sliding windows
units <- seqUnitSlidingWindows(gdsfile)

v1 <- seqUnitApply(gdsfile, units, "genotype", function(x) dim(x)[3L],
as.is="unlist", .progress=TRUE)
v2 <- seqUnitApply(gdsfile, units, "genotype", function(x) dim(x)[3L],
as.is="unlist", parallel=2, .progress=TRUE)

all(v1 == lengths(units$index))
all(v1 == v2)

# call with an external R variable
ext <- list(x=1:1348/10)
v3 <- seqUnitApply(gdsfile, units, "$:x", function(x) x,
as.is="list", .progress=TRUE, .envir=ext)
head(units$index)
head(v3)

table(sapply(seq_along(units$index), function(i) all(units$index[[i]] == v3[[i]]*10)))
# all TRUE

# close the GDS file
seqClose(gdsfile)

seqUnitCreate Subset and merge the units

Description

Subset and merge the variant unit(s).

Usage

seqUnitCreate(idx, desp=NULL)
seqUnitSubset(units, i)
seqUnitMerge(ut1, ut2)
seqUnitFilterCond

**Arguments**

- `idx` a list of numeric indexing vectors for specifying variants
- `desp` a `data.frame` for annotating the variant sets
- `units` a list of units of selected variants, with S3 class `SeqUnitListClass`
- `ut1` a list of units of selected variants, with S3 class `SeqUnitListClass`
- `ut2` a list of units of selected variants, with S3 class `SeqUnitListClass`
- `i` a numeric or logical vector for indices specifying elements

**Value**

The variant unit of `SeqUnitListClass`.

**Author(s)**

Xiuwen Zheng

**See Also**

`seqUnitSlidingWindows`, `seqUnitFilterCond`

**Examples**

```r
# open the GDS file
gdsfile <- seqOpen(seqExampleFileName("gds"))

# variant units via sliding windows
units <- seqUnitSlidingWindows(gdsfile)
(u1 <- seqUnitSubset(units, 1:10))
(u2 <- seqUnitSubset(units, 30:39))
seqUnitMerge(u1, u2)
seqUnitCreate(list(1:10, 20:30), data.frame(gene=c("g1", "g2")))

# close the GDS file
seqClose(gdsfile)
```

**Description**

Filters out the unit variants according to MAF, MAC and missing rates.
seqUnitFilterCond

Usage

seqUnitFilterCond(gdsfile, units, maf=NaN, mac=1L, missing.rate=NaN,
minsize=1L, parallel=seqGetParallel(), verbose=TRUE)

Arguments

gdsfile a SeqVarGDSClass object
units a list of units of selected variants, with S3 class SeqUnitListClass
maf minimum minor reference allele frequency, or a range of MAF maf[1] <= ... < maf[2]
mac minimum minor reference allele count, or a range of MAC mac[1] <= ... < mac[2]
missing.rate maximum missing genotype rate
minsize the minimum of unit size
parallel FALSE (serial processing), TRUE (multicore processing), numeric value or other value; parallel is passed to the argument cl in seqParallel, see seqParallel for more details.
verbose if TRUE, show information

Value

A S3 object with the class name "SeqUnitListClass" and two components (desp and index): the first is a data.frame with columns "chr", "start" and "end", and the second is list of integer vectors (the variant indices).

seqUnitSlidingWindows  Sliding units of selected variants

Description

Generates units of selected variants via sliding windows.

Usage

seqUnitSlidingWindows(gdsfile, win.size=5000L, win.shift=2500L, win.start=0L,
dup.rm=TRUE, verbose=TRUE)

Arguments

gdsfile  a SeqVarGDSClass object
win.size  window size in basepair
win.shift  the shift of sliding window in basepair
win.start  the start position in basepair
dup.rm  if TRUE, remove duplicate and zero-length windows
verbose  if TRUE, display information

Value

A S3 object with the class name "SeqUnitListClass" and two components (desp and index): the first is a data.frame with columns "chr", "start" and "end", and the second is list of integer vectors (the variant indices).

seqUnitApply, seqUnitFilterCond
Examples

```r
# open the GDS file
gdsfile <- seqOpen(seqExampleFileName("gds"))

v <- seqUnitSlidingWindows(gdsfile)
v # "desp" "index"

# close the GDS file
seqClose(gdsfile)
```

Description

A `SeqVarGDSClass` object provides access to a GDS file containing Variant Call Format (VCF) data. It extends `gds.class`.

Details

A SeqArray GDS file is created from a VCF file with `seqVCF2GDS`. This file can be opened with `seqOpen` to create a `SeqVarGDSClass` object.

Accessors

In the following code snippets `x` is a `SeqVarGDSClass` object.

```r
granges(x) Returns the chromosome and position of variants as a `GRanges` object. Names correspond to the variant.id.
ref(x) Returns the reference alleles as a `DNAStringSet`.
alt(x) Returns the alternate alleles as a `DNAStringSetList`.
qual(x) Returns the quality scores.
filt(x) Returns the filter data.
fixed(x) Returns the fixed fields (ref, alt, qual, filt).
header(x) Returns the header as a `DataFrameList`.
rowRanges(x) Returns a `GRanges` object with metadata.
colData(x) Returns a `DataFrame` with sample identifiers and any information in the 'sample.annotation' node.
info(x, info=NULL) Returns the info fields as a `DataFrame`. info is a character vector with the names of fields to return (default is to return all).
geno(x, geno=NULL) Returns the geno (format) fields as a `SimpleList`. geno is a character vector with the names of fields to return (default is to return all).
```

Other data can be accessed with `seqGetData`. 
Coercion methods

In the following code snippets `x` is a `SeqVarGDSClass` object.

```r
seqAsVCF(x, chr.prefix="", info=NULL, geno=NULL):
```

`gds.class`, `seqOpen`

Examples

```r
gds <- seqOpen(seqExampleFileName("gds"))
gds

## sample ID
head(seqGetData(gds, "sample.id"))

## variants
granges(gds)

## Not run:
## alleles as comma-separated character strings
head(seqGetData(gds, "allele"))

## alleles as DNAStringSet or DNAStringSetList
ref(gds)
v <- alt(gds)

## genotype
geno <- seqGetData(gds, "genotype")
dim(geno)
## dimensions are: allele, sample, variant
geno[1,1:10,1:5]

## rsID
head(seqGetData(gds, "annotation/id"))

## alternate allele count
head(seqGetData(gds, "annotation/info/AC"))

## individual read depth
depth <- seqGetData(gds, "annotation/format/DP")
names(depth)
## VCF header defined DP as variable-length data
table(depth$length)
## all length 1, so depth$data should be a sample by variant matrix
dim(depth$data)
depth$data[1:10,1:5]
```
seqVCF2GDS

Reformat VCF Files

Description

Reformats Variant Call Format (VCF) files.

Usage

seqVCF2GDS(vcf.fn, out.fn, header=NULL, storage.option="LZMA_RA", 
info.import=NULL, fmt.import=NULL, genotype.var.name="GT", 
ignore.chr.prefix="chr", scenario=c("general", "imputation"), 
reference=NULL, start=1L, count=-1L, optimize=TRUE, raise.error=TRUE, 
digest=TRUE, parallel=FALSE, verbose=TRUE)

seqBCF2GDS(bcf.fn, out.fn, header=NULL, storage.option="LZMA_RA", 
info.import=NULL, fmt.import=NULL, genotype.var.name="GT", 
ignore.chr.prefix="chr", scenario=c("general", "imputation"), 
reference=NULL, optimize=TRUE, raise.error=TRUE, digest=TRUE, 
bctools="bcftools", verbose=TRUE)

Arguments

vcf.fn the file name(s) of VCF format; or a connection object
bcf.fn a file name of binary VCF format (BCF)
out.fn the file name of output GDS file
header if NULL, header is set to be seqVCF_Header(vcf.fn)
storage.option specify the storage and compression option, "ZIP_RA" (seqStorageOption("ZIP_RA")); or "LZMA_RA" to use LZMA compression algorithm with higher compression ratio by default; or "LZ4_RA" to use an extremely fast compression and decompression algorithm. "ZIP_RA.max", "LZMA_RA.max" and "LZ4_RA.max" correspond to the algorithms with a maximum compression level; the suffix "_RA" indicates that fine-level random access is available; see more details at seqStorageOption
info.import characters, the variable name(s) in the INFO field for import; or NULL for all variables
fmt.import characters, the variable name(s) in the FORMAT field for import; or NULL for all variables
genotype.var.name the ID for genotypic data in the FORMAT column; "GT" by default (in VCF v4)
ignore.chr.prefix
a vector of character, indicating the prefix of chromosome which should be ignored, like "chr"; it is not case-sensitive
scenario
"general": use float32 to store floating-point numbers (by default); "imputation": use packedreal16 to store DS and GP in the FORMAT field with four decimal place accuracy
reference
genome reference, like "hg19", "GRCh37"; if the genome reference is not available in VCF files, users could specify the reference here
start
the starting variant if importing part of VCF files
count
the maximum count of variant if importing part of VCF files, -1 indicates importing to the end
optimize
if TRUE, optimize the access efficiency by calling cleanup.gds
raise.error
TRUE: throw an error if numeric conversion fails; FALSE: get missing value if numeric conversion fails
digest
a logical value (TRUE/FALSE) or a character ("md5", "sha1", "sha256", "sha384" or "sha512"); add md5 hash codes to the GDS file if TRUE or a digest algorithm is specified
parallel
FALSE (serial processing), TRUE (parallel processing), a numeric value indicating the number of cores, or a cluster object for parallel processing; parallel is passed to the argument cl in seqParallel, see seqParallel for more details
verbose
if TRUE, show information
bcftools
the path of the program bcftools

Details
If there are more than one files in vcf.fn, seqVCF2GDS will merge all VCF files together if they contain the same samples. It is useful to merge multiple VCF files if variant data are split by chromosomes.

The real numbers in the VCF file(s) are stored in 32-bit floating-point format by default. Users can set storage.option=seqStorageOption(float.mode="float64") to switch to 64-bit floating point format. Or packed real numbers can be adopted by setting storage.option=seqStorageOption(float.mode="packedreal16:scale=0.0001"). By default, the compression method is "LZMA_RA" (https://tukaani.org/xz/, LZMA algorithm with default compression level + independent data blocks for fine-level random access). Users can maximize the compression ratio by storage.option="LZMA_RA.max" or storage.option=seqStorageOption("LZMA_RA.max"); LZMA is known to have higher compression ratio than the zlib algorithm. LZ4 (https://github.com/lz4/lz4) is an option via storage.option="LZ4_RA" or storage.option=seqStorageOption("LZ4_RA"). If multiple cores/processes are specified in parallel, all VCF files are scanned to calculate the total number of variants before format conversion, and then split by the number of cores/processes. storage.option="Ultra" and storage.option="UltraMax" need much larger memory than other compression methods. Users may consider using seqRecompress to recompress the GDS file after calling seqVCF2GDS() with storage.option="ZIP_RA", since seqRecompress() compresses data nodes one by one, taking much less memory than "Ultra" and "UltraMax". If storage.option="LZMA_RA" runs out of memory (e.g., there are too many annotation fields in the VCF file), users could use storage.option="ZIP_RA" and then call seqRecompress(), compress="LZMA").
Value

Return the file name of GDS format with an absolute path.

           info.import=character(0), fmt.import=character(0))

# display
(f <- seqOpen("tmp.gds"))
seqClose(f)
seqVCF_Header

Parse the Header of a VCF/BCF File

Description

Parses the meta-information lines of a VCF or BCF file.

Usage

seqVCF_Header(vcf.fn, getnum=FALSE)

Arguments

- **vcf.fn**: the file name of VCF or BCF format; or a connection object for VCF format
- **getnum**: if TRUE, return the total number of variants

Details

The ID description contains four columns: ID – variable name; Number – the number of elements, see the webpage of the 1000 Genomes Project; Type – data type; Description – a variable description.

Value

Return a list (with a class name "SeqVCFHeaderClass", S3 object):

- **fileformat**: the file format
- **info**: the ID description in the INFO field
- **filter**: the ID description in the FILTER field
- **format**: the ID description in the FORMAT field
- **alt**: the ID description in the ALT field
- **contig**: the description in the contig field
- **assembly**: the link of assembly
- **reference**: genome reference, or NULL if unknown
- **header**: the other header lines
- **ploidy**: ploidy, two for humans
- **num.sample**: the number of samples
- **num.variant**: the number of variants, applicable only if getnum=TRUE
- **sample.id**: a vector of sample IDs in the VCF/BCF file
