Package ‘lefser’

May 29, 2024

Type Package

Title R implementation of the LEfSE method for microbiome biomarker discovery

Description lefser is an implementation in R of the popular "LDA Effect Size (LEfSe)" method for microbiome biomarker discovery. It uses the Kruskal-Wallis test, Wilcoxon-Rank Sum test, and Linear Discriminant Analysis to find biomarkers of groups and sub-groups.

Version 1.14.0

Date 2024-04-27

License Artistic-2.0

Depends SummarizedExperiment, R (>= 4.0.0)

Imports coin, MASS, ggplot2, S4Vectors, stats, methods, utils, dplyr

Suggests knitr, rmarkdown, curatedMetagenomicData, BiocStyle, phyloseq, testthat, pkgdown, covr, withr

Encoding UTF-8

**lefser**  
*R implementation of the LEfSe method*

**Description**

Perform a LEfSe analysis: the function carries out differential analysis between two sample groups for multiple features and uses linear discriminant analysis to establish their effect sizes. Subclass information for each class can be incorporated into the analysis (see examples). Features with large differences between two sample groups are identified as biomarkers.

**Usage**

```r
lefser(
  relab,
  kruskal.threshold = 0.05,
  wilcox.threshold = 0.05,
  lda.threshold = 2,
  groupCol = "GROUP",
  blockCol = NULL,
  assay = 1L,
  trim.names = FALSE,
  checkAbundances = TRUE,
  ...
)
```
Arguments

relab A SummarizedExperiment with relative abundances in the assay

kruskal.threshold numeric(1) The p-value for the Kruskal-Wallis Rank Sum Test (default 0.05).

wilcox.threshold numeric(1) The p-value for the Wilcoxon Rank-Sum Test when 'blockCol' is present (default 0.05).

lda.threshold numeric(1) The effect size threshold (default 2.0).

groupCol character(1) Column name in colData(relab) indicating groups, usually a factor with two levels (e.g., c("cases", "controls"); default "GROUP").

blockCol character(1) Optional column name in colData(relab) indicating the blocks, usually a factor with two levels (e.g., c("adult", "senior"); default NULL).

assay The i-th assay matrix in the SummarizedExperiment ('relab'; default 1).

trim.names Default is FALSE. If TRUE, this function extracts the most specific taxonomic rank of organism.

checkAbundances logical(1) Whether to check if the assay data in the relab input are relative abundances or counts. If counts are found, a warning will be emitted (default TRUE).

expr (deprecated) Use relab instead. A SummarizedExperiment with relative abundances in the assay

... Additional inputs to lower level functions (not used).

Details

The LEfSe method expects relative abundances in the expr input. A warning will be emitted if the column sums do not result in 1. Use the relativeAb helper function to convert the data in the SummarizedExperiment to relative abundances. The checkAbundances argument enables checking the data for presence of relative abundances and can be turned off by setting the argument to FALSE.

Value

The function returns a data.frame with two columns, which are names of features and their LDA scores.

Examples

# (1) Using classes only
data(zeller14)
# exclude 'adenoma'
zeller14 <- zeller14[, zeller14$study_condition != "adenoma"]
res_group <- lefser(relativeAb(zeller14),
    groupCol = "study_condition")
head(res_group)
# (2) Using classes and subclasses

data(zeller14)

# exclude 'adenoma'
zeller14 <- zeller14[ , zeller14$study_condition != "adenoma"]

res_block <- lefser(relativeAb(zeller14),
                   groupCol = "study_condition",
                   blockCol = "age_category")

head(res_block)

---

**lefserPlot**  
*Plots results from lefser function*

### Description

This function plots the biomarkers found by LEfSe, that are ranked according to their effect sizes and linked to their abundance in each class.

### Usage

```r
lefserPlot(
  df,
  colors = c("red", "forestgreen"),
  trim.names = TRUE,
  title = "",
  label.font.size = 3
)
```

### Arguments

- `df`  
  Data frame produced by `lefser`.
- `colors`  
  A character(2). Colors corresponding to class 0 and 1. Defaults to `c("red", "forestgreen")`.
- `trim.names`  
  Under the default (TRUE), this function extracts the most specific taxonomic rank of organism.
- `title`  
  A character(1). The title of the plot.
- `label.font.size`  
  A numeric(1). The font size of the feature labels. The default is 3.

### Value

Function returns plot of effect size scores produced by `lefser`. Positive scores represent the biomarker is more abundant in class '1'. Negative scores represent the biomarker is more abundant in class '0'.

### Examples

```r
example("lefser")
lefserPlot(res_group)
```
relativeAb  

Utility function to calculate relative abundances

Description

The function calculates the column totals and divides each value within the column by the respective column total.

This function calculates the relative abundance of each feature in the SummarizedExperiment object containing count data, expressed as counts per million (CPM)

Usage

relativeAb(se, assay = 1L)

Arguments

se  A SummarizedExperiment object with counts
assay  The i-th assay matrix in the SummarizedExperiment ('relab'; default 1).

Value

returns a new SummarizedExperiment object with counts per million calculated and added as a new assay named rel_abs.

Examples

se <- SummarizedExperiment(
  assays = list(
    counts = matrix(
      rep(1, 4), ncol = 1, dimnames = list(LETTERS[1:4], "SAMP")
    )
  )
)
assay(se)
assay(relativeAb(se))

zeller14  

Example dataset for lefse

Description

The ZellerG_2014 dataset contains microbiome count data for CRC patients and controls. It was for curatedMetagenomicData using the script in the package directory "data-raw".
Usage

data("zeller14")

Format

A SummarizedExperiment with 1585 features, 199 samples

study_condition  adenoma, control, CRC
age_category  adult, senior
