pcxn Exploring, analyzing and visualizing functions utilizing the pcxnData package

Description

Discover the correlated pathways/gene sets of a single pathway/gene set or discover correlation relationships among multiple pathways/gene sets. Draw a heatmap or create a network of your query and extract members of each pathway/gene set found in the available collections (MSigDB H hallmark, MSigDB C2 Canonical pathways, MSigDB C5 GO BP and Pathprint).

# Analyse relationships between groups of pathways shown to be enriched in the
# collection by gene set enrichment (correlation coefficients are not adjusted
# for gene overlap)
A pcxn object produced by pcxn_explore() or pcxn_analyze(). It holds the corresponding analysis, the data produced by the analysis and the geneset groups involved.

Description

A pcxn object produced by pcxn_explore() or pcxn_analyze(). It holds the corresponding analysis, the data produced by the analysis and the geneset groups involved.

Value

pcxn object with a type, data and geneset_groups field

Slots

  type character.
  data matrix.
  geneset_groups list.

Examples

# Create and show a pcxn object
pcxn <- pcxn_explore("pathprint","Alzheimer's disease (KEGG)", 10, 0.05, 0.05)

pcxn
pcxn_explore_analyze

Discover correlated pathway/gene sets of a single pathway/gene set or correlation relationships among multiple pathways/gene sets.

Description

Using pcxn_explore, select a single pathway/gene set from one of the four collections (MSigDB H hallmark gene sets, MSigDB C2 Canonical pathways, MSigDB C5 GO BP gene sets, and Pathprint) and discover its correlated pathway/gene sets within the same collection.

Using pcxn_analyze, discover correlation relationships among multiple pathways/gene sets identified by GSEA (gene set enrichment analysis). All the input pathways/gene sets should come from the same collection. MSigDB H hallmark gene sets, MSigDB C2 Canonical pathways, MSigDB C5 GO BP gene sets, and Pathprint are treated as four separate collections.

Usage

pcxn_explore(collection = c("pathprint", "MSigDB_H", "MSigDB_C2_CP", "MSigDB_C5_GO_BP"),
query_geneset,
adj_overlap = FALSE,
top = 10,
min_abs_corr = 0.05,
max_pval = 0.05)

pcxn_analyze(collection = c("pathprint", "MSigDB_H", "MSigDB_C2_CP", "MSigDB_C5_GO_BP"),
phenotype_0_genesets,
phenotype_1_genesets,
adj_overlap = FALSE,
top = 10,
min_abs_corr = 0.05,
max_pval = 0.05)

Arguments

collection pathways’ collection chosen among: "pathprint", "MSigDB_H", "MSigDB_C2_CP", "MSigDB_C5_GO_BP"
query_geneset the single pathway of interest
phenotype_0_genesets genesets/pathways of the first group of pathways
phenotype_1_genesets genesets/pathways of the second group of pathways
adj_overlap whether the correlation coefficients are adjusted for gene overlap
top most correlated genesets/pathways
min_abs_corr minimum absolute correlation
max_pval maximum p-value
pcxn_gene_members

Value

a pcxn object

Author(s)

Sokratis Kariotis

Examples

# pcxn_explore function can be used with the default parameters:
pcxn_explore("pathprint","Alzheimer's disease (KEGG)"

# If specific parameters are desired we can use the full list of arguments:
pcxn_explore("pathprint","Alzheimer's disease (KEGG)", FALSE, 100, 0.02, 0.045)

# pcxn_analyze can be used with two gene sets and the default parameters:
pcxn_analyze("pathprint",c("ABC transporters (KEGG)", "ACE Inhibitor Pathway (Wikipathways)", "AR down reg. targets (Netpath)", c("DNA Repair (Reactome)"))

# Alternatively, you can use only one gene set:
pcxn_analyze("MSigDB_H",c("HALLMARK_COAGULATION", "HALLMARK_UV_RESPONSE_UP")

# If specific parameters are desired we can use the full list of arguments:
pcxn_analyze("pathprint",c("ABC transporters (KEGG)", "ACE Inhibitor Pathway (Wikipathways)", "AR down reg. targets (Netpath)", c("DNA Repair (Reactome)", FALSE, top = 100, min_abs_corr = 0.025, max_pval = 0.03)

---

pcxn_gene_members

Acquire the gene members of a pathway from the pcxnData package

Description

Acquire the gene members of one of the available pathways that belong to MSigDB H hallmark pathways, MSigDB C2 Canonical pathways, MSigDB C5 GO BP gene sets or Pathprint genesets
pcxn_gene_members

Usage

pcxn_gene_members(pathway_name = "Alzheimer's disease (KEGG)")

Arguments

pathway_name  the pathway whose members we want

Value

a matrix of Entrez IDs and gene symbols

Author(s)

Sokratis Kariotis

Examples

# Get the members of a single pathway
pcxn_gene_members("Alzheimer's disease (KEGG)")

pcxn_heatmap

Draw a heatmap of a pcxn object

Description

Draw a heatmap of a pcxn object where color represents correlation coefficients.

Usage

pcxn_heatmap(object, cluster_method = "complete")

Arguments

object  pcxn object created by pcxn_explore or pcxn_analyze functions
cluster_method  clustering method drawn from: "ward.D", "ward.D2", "single", "complete", "average", "mcquitty", "median", "centroid"

Value

a pheatmap object

Author(s)

Sokratis Kariotis

See Also

pcxn_network
Examples

# Draw a heatmap of a pcxn object with a specific clustering method
object <- pcxn_explore("pathprint","Alzheimer's disease (KEGG)",10,0.05,0.05)

pcxn_heatmap(object,"complete")

pcxn_network

Create a network of a pcxn object

Description
Create a network of a pcxn object

Usage
pcxn_network(object)

Arguments
object pcxn object created by explore or analyze functions

Value
draws a tkplot object and saves a graph object representing the network

Examples

# Create a network of a pcxn object
object <- pcxn_explore("pathprint","Alzheimer's disease (KEGG)",10,0.05,0.05)

# network <- pcxn_network(object)
