Package ‘plyinteractions’

May 4, 2024

Title  Extending tidy verbs to genomic interactions

Description  Operate on `GInteractions` objects as tabular data using `dplyr`-like verbs. The functions and methods in `plyinteractions` provide a grammatical approach to manipulate `GInteractions`, to facilitate their integration in genomic analysis workflows.

plyinteractions-package

plyinteractions: a grammar of data manipulation for genomic interactions

Description

plyinteractions is a dplyr-like API to the GInteractions infrastructure in Bioconductor.

Details

plyinteractions provides a consistent interface for importing and wrangling genomic interactions from a variety of sources. The package defines a grammar of genomic interactions manipulation through a set of verbs. These verbs can be used to construct human-readable analysis pipelines based on GInteractions.

- Group genomic interactions with `group_by`;
- Summarize grouped genomic interactions with `summarize`;
- Tally/count grouped genomic interactions with `tally` and `count`;
- Modify genomic interactions with `mutate`;
- Subset genomic interactions with `filter` using `<data-masking>` and logical expressions;
- Pick out any columns from the associated metadata with `select` using `<tidy-select>` arguments;
- Subset using indices with `slice`;
- Order genomic interactions with `arrange` using categorical/numerical variables.

For more details on the features of plyinteractions, read the vignette: `browseVignettes(package = "plyinteractions")`

**Description**
Enhanced GInteractions getters

**Usage**

```r
anchors1(x)
anchors2(x)
seqnames1(x)
seqnames2(x)
start1(x)
start2(x)
end1(x)
end2(x)
width1(x)
width2(x)
strand1(x)
strand2(x)
ranges1(x)
ranges2(x)

## S4 method for signature 'GInteractions'
x$name

## S4 method for signature 'GInteractions'
anchors1(x)

## S4 method for signature 'GInteractions'

## S4 method for signature 'GInteractions'
```
seqnames1(x)
## S4 method for signature 'GInteractions'
seqnames2(x)
## S4 method for signature 'GInteractions'
start1(x)
## S4 method for signature 'GInteractions'
start2(x)
## S4 method for signature 'GInteractions'
end1(x)
## S4 method for signature 'GInteractions'
end2(x)
## S4 method for signature 'GInteractions'
width1(x)
## S4 method for signature 'GInteractions'
width2(x)
## S4 method for signature 'GInteractions'
strand1(x)
## S4 method for signature 'GInteractions'
strand2(x)
## S4 method for signature 'GInteractions'
ranges1(x)
## S4 method for signature 'GInteractions'
ranges2(x)

Arguments

x a GInteractions object
name The pattern or name of a column stored in the GInteractions metadata (mcols).

Value

One of the core GInteractions fields (e.g. seqnames1, start1, ...) or one of the metadata columns when using $. Note that auto-completion works with $.

Examples

gi <- data.frame(
  seqnames1 = 'chr1', start1 = 1, end1 = 10,
seqnames2 = 'chr1', start2 = 2, end2 = 20
|> as_ginteractions() |> mutate(type = 'cis')
anchors1(gi)
anchors2(gi)
seqnames1(gi)
seqnames2(gi)
start1(gi)
start2(gi)
end1(gi)
end2(gi)
width1(gi)
width2(gi)
ranges1(gi)
ranges2(gi)
strand1(gi)
strand2(gi)
gi$type

annotate

Annotate both anchors of a GInteractions

Description

For each interaction in a GInteractions object, annotate returns the pairs of annotations from the GRanges object it overlaps with.

Usage

annotate(x, y, by)
annotate_directed(x, y, by)

## S4 method for signature 'GInteractions,GRanges,character'
annotate(x, y, by)

## S4 method for signature 'GInteractions,GRanges,character'
annotate_directed(x, y, by)

Arguments

x a GInteractions object
y a GRanges object to extract annotations from
by Column name from y to use to extract annotations

Value

a GInteractions object with two extra metadata columns named by.1 and by.2.
Examples

# 1. Basic example

```r
# Examples
# 1. Basic example

gi <- read.table(text = "
chr1 11 20 - chr1 21 30 +
chr1 21 30 + chr2 51 60 +",
col.names = c(
  "seqnames1", "start1", "end1", "strand1",
  "seqnames2", "start2", "end2", "strand2"
)) |> as_ginteractions()

gr <- GenomicRanges::GRanges(c("chr1:20-30:+", "chr2:55-65:+")) |> plyranges::mutate(id = 1:2)

annotate(gi, gr, by = 'id')

annotate_directed(gi, gr, by = 'id')
```

# 2. Match loops with tiled genomic bins

```r
# 2. Match loops with tiled genomic bins

data(GM12878_HiCCUPS)
loops <- GM12878_HiCCUPS |>
  pin_by('first') |>
  anchor_center() |>
  mutate(width1 = 500) |>
  pin_by('second') |>
  anchor_center() |>
  mutate(width2 = 500)

genomic_bins <- GenomeInfoDb::getChromInfoFromUCSC('hg19', assembled.molecules.only = TRUE, as.Seqinfo = TRUE) |> plyranges::tileGenome(tilewidth = 10000) |> unlist() |> plyranges::mutate(binID = seq_len(plyranges::n()))

annotate(loops, genomic_bins, by = 'binID') |> select(starts_with('binID'))
```

# 3. Annotate interactions by a set of regulatory elements

```r
# 3. Annotate interactions by a set of regulatory elements

data(ce10_ARCC)
data(ce10_REs)
annotate(ce10_ARCC, ce10_REs, by = 'annot') |> count(annot.1, annot.2)
```
as_ginteractions

Construct a GInteractions object from a tibble, DataFrame or data.frame

Description

The as_ginteractions function looks for column names in .data called seqnames{1,2}, start{1,2}, end{1,2}, and strand{1,2} in order to construct a GInteractions object. By default other columns in .data are placed into the mcols (metadata columns) slot of the returned object.

Usage

as_ginteractions(
    .data,
    ..., 
    keep.extra.columns = TRUE,
    starts.in.df.are.0based = FALSE
)

Arguments

.data A data.frame(), DataFrame() or tibble() to construct a GInteractions object from.

... Optional named arguments specifying which the columns in .data containin the core components a GInteractions object.

keep.extra.columns TRUE or FALSE (the default). If TRUE, the columns in df that are not used to form the genomic ranges of the returned GRanges object are then returned as metadata columns on the object. Otherwise, they are ignored.

starts.in.df.are.0based TRUE or FALSE (the default). If TRUE, then the start positions of the genomic ranges in df are considered to be 0-based and are converted to 1-based in the returned GRanges object.

Value

a GInteractions object.

Examples

# 1. GInteractions from bedpe files imported into a data.frame

```r
bedpe <- read.table(text = "
chr1 100 200 chr1 5000 5100 bedpe_example1 30 + -
chr1 1000 5000 chr1 3000 3800 bedpe_example2 100 + -",
col.names = c("chrom1", "start1", "end1",
              "chrom2", "start2", "end2", "name", "score", "strand1", "strand2"))
bedpe |> 
as_ginteractions(seqnames1 = chrom1, seqnames2 = chrom2)
```

# 2. GInteractions from standard pairs files imported into a data.frame

```
# Note how the pairs are 0-based and no "end" field is provided
# (the standard pairs file format does not have "end" fields)
# We can provide width1 and width2 to fix this problem.

pairs <- read.table(text = "
pair1 chr1 10000 chr1 20000 + +
pair2 chr1 50000 chr1 70000 + +
pair3 chr1 60000 chr2 10000 + +
pair4 chr1 30000 chr3 40000 + -",
col.names = c("pairID", "chr1", "pos1", "chr2", "pos2", "strand1", "strand2"))
pairs |> 
as_ginteractions(
    seqnames1 = chr1, start1 = pos1, width1 = 1000,
    seqnames2 = chr2, start2 = pos2, width2 = 1000,
    starts.in.df.are.0based = TRUE
)
```

# 3. GInteractions from data.frame with extra fields

```
df <- read.table(text = "
chr1 100 200 chr1 5000 5100
chr1 1000 5000 chr1 3000 3800",
col.names = c("chr1", "start1", "end1", "chr2", "start2", "end2"))
df |> 
as_ginteractions(seqnames1 = chr1, seqnames2 = chr2)
```

```
df <- read.table(text = "
chr1 100 200 chr1 5000 5100
chr1 1000 5000 chr1 3000 3800",
col.names = c("chr1", "start1", "end1", "chr2", "start2", "end2"))
```

Interactions identified in L3 C. elegans by ARC-C

Description
Supplemental Table 2 obtained from Genome Biology online publication.
Huang N, Seow WQ, Appert A, Dong Y, Stemptor P and Ahringer J Accessible Region Conformation Capture (ARC-C) gives high-resolution insights into genome architecture and regulation. Genome Res 2022 Feb;32(2):357-366. PMID: 34933938

Usage

Methods for DelegatingGIInteractions objects

Description

Methods for DelegatingGIInteractions objects

Usage

```r
## S4 method for signature 'DelegatingGIInteractions'
anchors1(x)

## S4 method for signature 'DelegatingGIInteractions'
ranges1(x)

## S4 method for signature 'DelegatingGIInteractions'
seqnames1(x)
```
## S4 method for signature 'DelegatingGInteractions'
start1(x)

## S4 method for signature 'DelegatingGInteractions'
end1(x)

## S4 method for signature 'DelegatingGInteractions'
width1(x)

## S4 method for signature 'DelegatingGInteractions'
strand1(x)

## S4 method for signature 'DelegatingGInteractions'
anchors2(x)

## S4 method for signature 'DelegatingGInteractions'
ranges2(x)

## S4 method for signature 'DelegatingGInteractions'
seqnames2(x)

## S4 method for signature 'DelegatingGInteractions'
start2(x)

## S4 method for signature 'DelegatingGInteractions'
end2(x)

## S4 method for signature 'DelegatingGInteractions'
width2(x)

## S4 method for signature 'DelegatingGInteractions'
strand2(x)

## S4 method for signature 'DelegatingGInteractions'
anchors(x)

## S4 method for signature 'DelegatingGInteractions'
regions(x)

## S4 method for signature 'DelegatingGInteractions'
seqinfo(x)

## S4 method for signature 'DelegatingGInteractions'
mcols(x)

## S4 method for signature 'DelegatingGInteractions'
show(object)
Value

One of the core GInteractions fields (e.g. seqnames1, start1, ...)

---

**dpolyr-arrange**

*Arrange a GInteractions by a column*

---

Description

Arrange a GInteractions by a column

Usage

```r
## S3 method for class 'GInteractions'
arrange(.data, ...)
```

Arguments

- `.data` a GInteractions object
- `...` Variables, or functions of variables. Use `dpolyr::desc()` to sort a variable in descending order.

Value

a GInteractions object.

Examples

```r
gi <- read.table(text = "
chr1 1 10 chr1 1 10
chr1 2 10 chr2 1 10
chr3 3 10 chr3 1 10
chr4 4 10 chr4 1 10
chr5 5 10 chr5 1 10",
col.names = c("seqnames1", "start1", "end1",
"seqnames2", "start2", "end2")
) |> as_ginteractions() |> mutate(cis = seqnames1 == seqnames2, score = runif(5)*100, gc = runif(5))
gi

# 1. Arrange GInteractions by a numerical column
# 1.1. `arrange(gc)`

# 2. Arrange GInteractions by a logical column
```
# 3. Arrange GInteractions by a factor

```r
gi |> arrange(cis)
```

# 4. Combine sorting variables

```r
gi |
mutate(rep = factor(c("rep1", "rep2", "rep1", "rep2", "rep1"))) |>
arrange(rep)
```

---

**dplyr-count**  
*Count or tally GInteractions per group*

**Description**

Count or tally GInteractions per group

**Usage**

```r
## S3 method for class 'GroupedGInteractions'
tally(x, wt = NULL, sort = FALSE, name = NULL)
```

```r
## S3 method for class 'GroupedGInteractions'
count(x, ..., wt = NULL, sort = FALSE, name = NULL)
```

```r
## S3 method for class 'GInteractions'
count(x, ..., wt = NULL, sort = FALSE, name = NULL)
```

**Arguments**

- `x`: A grouped GInteractions object
- `wt`: *<data-masking>* Frequency weights. Can be NULL or a variable:
  - If NULL (the default), counts the number of rows in each group.
  - If a variable, computes sum(wt) for each group.
- `sort`: If TRUE, will show the largest groups at the top.
- `name`: The name of the new column in the output.
- `...`: *<data-masking>* Variables to group by.
Value

a S4Vectors::DataFrame() object, with an added column with the count/tablly per group.

Examples

```r
gi <- read.table(text = "
chr1 11 20 chr1 21 30 + +
chr1 11 20 chr1 51 55 + +
chr1 11 30 chr1 51 55 - -
chr1 11 30 chr2 51 60 - -",
col.names = c("seqnames1", "start1", "end1",
"seqnames2", "start2", "end2", "strand1", "strand2")
) |> as_ginteractions() |> 
  mutate(score = runif(4), type = c('cis', 'cis', 'cis', 'trans'))

# 1. Tally groups

# 2. Count per groups
```

---

**dplyr-filter**

*Subset a GInteractions with tidyverse-like filter*

**Description**

Subset a GInteractions with tidyverse-like filter

**Usage**

```r
## S3 method for class 'GInteractions'
fILTER(.data, ...)
```
Arguments

.data  a GInteractions object

Expressions that return a logical value, and are defined in terms of the variables in .data. If multiple expressions are included, they are combined with the & operator. Only rows for which all conditions evaluate to TRUE are kept.

Value

a GInteractions object.

Examples

```r
gi <- read.table(text = "
chr1 1 10 chr1 1 10
chr1 2 10 chr2 1 10
chr3 3 10 chr3 1 10
chr4 4 10 chr4 1 10
chr5 5 10 chr5 1 10",
col.names = c("seqnames1", "start1", "end1",
"seqnames2", "start2", "end2")
) |> as_ginteractions() |> mutate(cis = seqnames1 == seqnames2, score = runif(5)*100, gc = runif(5))
gi

# 1. Filter metadata columns from GInteractions by condition

gi |> filter(gc > 0.1)
gi |> filter(gc > 0.1, score > 50)
gi |> filter(cis)

# 2. On-the-fly calculations

gi

gi |> filter(start1 >= start2 + 3)
gi |> filter(score * gc > score * 0.5)
```

dplyr-group_by

---

Group GInteractions by columns

Description

Group GInteractions by columns
Usage

```r
## S3 method for class 'GInteractions'
group_by(.data, ..., .add = FALSE)

## S3 method for class 'DelegatingGInteractions'
group_by(.data, ..., .add = FALSE)

## S3 method for class 'GroupedGInteractions'
ungroup(x, ...)
```

Arguments

- `.data, x` a (Grouped)GInteractions object
- `...` Column(s) to group by.
- `.add` When FALSE, the default, group_by() will override existing groups. To add to the existing groups, use .add = TRUE.

Value

a GroupedGInteractions object. When a (Anchored)PinnedGInteractions object is grouped, both anchoring and pinning are dropped.

Examples

```r
gi <- read.table(text = "
chr1 11 20 chr1 21 30
chr1 11 20 chr1 51 55
chr1 11 30 chr1 51 55
chr1 11 30 chr2 51 60",
col.names = c(  
  "seqnames1", "start1", "end1",  
  "seqnames2", "start2", "end2")  
) |>  
as_ginteractions() |>
  mutate(type = c("cis", "cis", "cis", "trans"), score = runif(4))
```

```
# 1. Group by core column

```r
gi |> group_by(end1)
gi |> group_by(end1, end2) |> group_data()
```

```
# 2. Group by metadata column

```r
gi |> group_by(type) |> group_data()
```
# 3. Combine core and metadata column grouping

```r
gi |> group_by(end1, type)
gi |> group_by(end1, type) |> group_data()
```

# 4. Create a new column and group by this new variable

```r
gi |> group_by(class = c(1, 2, 1, 2))
```

# 5. Replace or add groups to a GroupedGInteractions

```r
ggi <- gi |> group_by(class = c(1, 2, 1, 2))
ggi |> group_data()
ggi |> group_by(type) |> group_data()
ggi |> group_by(type, .add = TRUE) |> group_data()
```

# 6. Ungroup GInteractions

```r
ggi <- gi |> group_by(type, class = c(1, 2, 1, 2))
ggi
ungroup(ggi, type)
ungroup(ggi, class)
```

---

**dplyr-mutate**

*Mutate columns from a GInteractions object*

**Description**

Mutate columns from a GInteractions object

**Usage**

```r
## S3 method for class 'GInteractions'
mutate(.data, ...)
```

**Arguments**

- `.data` a GInteractions object
- `...` Optional named arguments specifying which the columns in `.data` to create/modify.
Value

a GInteractions object.

Examples

gi <- read.table(text = "
chr1 10 20 chr1 50 51
chr1 10 50 chr2 30 40",
col.names = c("chr1", "start1", "end1", "chr2", "start2", "end2")) |> as_ginteractions(seqnames1 = chr1, seqnames2 = chr2)

# 1. Add metadata columns to a GInteractions object

gi |> mutate(type = c('cis', 'trans'), score = runif(2)) |> mutate(type2 = type)

# 2. More complex, nested or inplace changes

# 3. Core GInteractions columns can also be modified

# 4. Evaluating core GInteractions columns
**dplyr-rename**

**Rename columns from a GInteractions with tidyverse-like rename**

**Description**

Rename columns from a GInteractions with tidyverse-like rename

**Usage**

```r
## S3 method for class 'GInteractions'
rename(.data, ...)
```

**Arguments**

- `.data` a GInteractions object
- `...` Use `new_name = old_name` to rename selected variables.

**Value**

a GInteractions object.

**Examples**

```r
gi <- read.table(text = "
chr1 10 20 chr1 50 51
chr1 10 50 chr2 30 40",
col.names = c("chr1", "start1", "end1", "chr2", "start2", "end2")) |>
as_ginteractions(seqnames1 = chr1, seqnames2 = chr2) |>
m$mutate(type = c('cis', 'trans'), score = runif(2))
```

# 1. Rename metadata columns to a GInteractions object
```
gi | rename(interaction_type = type, GC = score)
```
**dplyr-select**  
*Select columns within GInteractions metadata columns*

**Description**

Select columns within GInteractions metadata columns

**Usage**

```r
## S3 method for class 'GInteractions'
select(.data, ..., .drop_ranges = FALSE)
```

**Arguments**

- `.data`: a GInteractions object
- `...`: Integer indicating rows to keep.
- `.drop_ranges`: if TRUE, returns a DataFrame object. In this case, it enables selection of any column including core GInteractions columns.

**Value**

a GInteractions object.

**Examples**

```r
gi <- read.table(text = "
chr1 1 10 chr1 1 10
chr2 1 10 chr2 1 10
chr3 1 10 chr3 1 10
chr4 1 10 chr4 1 10
chr5 1 10 chr5 1 10",
col.names = c("seqnames1", "start1", "end1",
"seqnames2", "start2", "end2")
) |> as_ginteractions() |> mutate(score = runif(5)*100, cis = TRUE, gc = runif(5))

# 1. Select metadata columns from GInteractions by index

```r
gi |> select(2, 1)
gi |> select(-3)
```

# 2. Select metadata columns from GInteractions by name

```r
```
gi |> select(gc, score)

# 3. Select metadata columns from GInteractions with <tidy-select>

gi |> select(contains('s'))
gi |> select(matches('s'))

# 4. Select core and metadata columns with .drop_ranges = TRUE

gi |> select(matches('s'), .drop_ranges = TRUE)

dplyr-slice
Slice a GInteractions rows by their index

Description
Slice a GInteractions rows by their index

Usage
## S3 method for class 'GInteractions'
slice(.data, ...)

Arguments
.data    a GInteractions object
...      Integer indicating rows to keep.

Value
a GInteractions object.

Examples

```r
gi <- read.table(text = "
chr1  1  10 chr1  1  10
chr2  1  10 chr2  1  10
chr3  1  10 chr3  1  10
chr4  1  10 chr4  1  10
chr5  1  10 chr5  1 10"
, col.names = c("seqnames1", "start1", "end1",
              "seqnames2", "start2", "end2"))
```

### 1. Slice a GInteractions

```r
gi |> slice(1, 2, 3)
gi |> slice(-3)
gi |> slice(1:2, 5:4)
```

---

**dpolyr-summarize**  
*Summarize GInteractions per group*

**Description**  
Summarize GInteractions per group

**Usage**

```r
## S3 method for class 'GroupedGInteractions'
summarise(.data, ...)
## S3 method for class 'GroupedGInteractions'
summarize(.data, ...)
```

**Arguments**

- `.data` a (grouped) GInteractions object
- `...` Name-value pairs of summary functions. The name will be the name of the variable in the result.

**Value**

a `S4Vectors::DataFrame()` object:

- The rows come from the underlying `group_keys()`.
- The columns are a combination of the grouping keys and the summary expressions that you provide.
- GInteractions class is not preserved, as a call to `summarize` fundamentally creates a new data frame

**Examples**

```r
gi <- read.table(text = "
chr1 11 20 chr1 21 30 + +
chr1 11 20 chr1 51 55 + +
chr1 11 30 chr1 51 55 - -
chr1 11 30 chr2 51 60 - -",
```
col.names = c(
  "seqnames1", "start1", "end1",
  "seqnames2", "start2", "end2", "strand1", "strand2")
)` as_ginteractions() |> mutate(score = runif(4), type = c('cis', 'cis', 'cis', 'trans'))

# 1. Summarize a single column

# 2. Summarize by multiple columns

gi | group_by(type) |> summarize(m = mean(score))
gi | group_by(strand1) |> summarize(m = mean(score))

df <- gi |>
  group_by(strand1) |> summarize(m = mean(score), n = table(seqnames2))
df
df$n

ginteractions-anchor  Manage GInteractions anchors with plyranges

Description
Manage GInteractions anchors with plyranges

Usage
## S3 method for class 'AnchoredPinnedGInteractions'
anchor(x)

## S3 method for class 'AnchoredPinnedGInteractions'
unanchor(x)

## S3 method for class 'PinnedGInteractions'
anchor_start(x)
Arguments

x A PinnedGInteractions object

Value

- anchor_* functions return an AnchoredPinnedGInteractions object.
- anchor returns a character string indicating where the pinned anchors are anchored at.
- unanchor removes the anchoring for a AnchoredPinnedGInteractions object.

Examples

gi <- read.table(text = "
col.names = c("seqnames1", "start1", "end1",
end2", "stran1", "strand2")

as_ginteracts() |>
```r
mutate(score = runif(4), type = c('cis', 'cis', 'cis', 'trans'))
```

# 1. Anchoring pinned genomic interactions with plyranges

```r
gi |> pin_by("second") |> anchor_end()
```

---

**ginteractions-count-overlaps**

*Count overlaps between a query GInteractions and a GRanges*

**Description**

Count overlaps between a query GInteractions and a GRanges

**Usage**

```r
## S3 method for class 'PinnedGInteractions'
count_overlaps(x, y, maxgap = -1L, minoverlap = 0L)
```

```r
## S3 method for class 'GInteractions'
count_overlaps(x, y, maxgap = -1L, minoverlap = 0L)
```

```r
## S3 method for class 'PinnedGInteractions'
count_overlaps_directed(x, y, maxgap = -1L, minoverlap = 0L)
```

```r
## S3 method for class 'GInteractions'
count_overlaps_directed(x, y, maxgap = -1L, minoverlap = 0L)
```

**Arguments**

- `x`: A (Pinned)GInteractions object
- `y`: A GRanges object
- `maxgap`, `minoverlap`

See `?countOverlaps` in the GenomicRanges package for a description of these arguments.

**Value**

An integer vector of same length as `x`.

**Pinned GInteractions**

When using `count_overlaps()` with a PinnedGInteractions object, only the pinned anchors are used to check for overlap with `y`. This is equivalent to specifying `use.region="both"` in `InteractionSet::findOverlaps()`.
Examples

```r
gi <- read.table(text = "
  chr1 11 20 - chr1 21 30 +
  chr1 11 20 - chr1 51 55 +
  chr1 21 30 - chr1 51 55 +
  chr1 21 30 - chr2 51 60 +",
col.names = c(  
"seqnames1", "start1", "end1", "strand1",  
"seqnames2", "start2", "end2", "strand2"  
)
) |> as_ginteractions() |> mutate(id = 1:4, type = 'gi')

gr <- GenomicRanges::GRanges(  
c("chr1:20-30:+", "chr2:55-65:-")  
) |> plyranges::mutate(id = 1:2, type = 'gr')

gi
gr

# 1. Count overlaps between GInteractions and a subject GRanges

count_overlaps(gi, gr)

count_overlaps_directed(gi, gr)

# 2. Count overlaps between PinnedGInteractions and a subject GRanges

gi |> pin_by("first") |> count_overlaps(gr)

gi |> pin_by("second") |> count_overlaps(gr)

gi |> pin_by("first") |> count_overlaps_directed(gr)

gi |> pin_by("second") |> count_overlaps_directed(gr)
```

---

**Filter GInteractions overlapping with a GRanges**

**Description**

Filter GInteractions overlapping with a GRanges
Usage

```r
## S3 method for class 'PinnedGInteractions'
filter_by_overlaps(x, y, maxgap = -1L, minoverlap = 0L)

## S3 method for class 'GInteractions'
filter_by_overlaps(x, y, maxgap = -1L, minoverlap = 0L)

## S3 method for class 'PinnedGInteractions'
filter_by_non_overlaps(x, y, maxgap = -1L, minoverlap = 0L)

## S3 method for class 'GInteractions'
filter_by_non_overlaps(x, y, maxgap = -1L, minoverlap = 0L)
```

Arguments

- `x`: A (Pinned)GInteractions object
- `y`: A GRanges object
- `maxgap`, `minoverlap`
  
  See `?countOverlaps` in the GenomicRanges package for a description of these arguments.

Value

An integer vector of same length as `x`.

Pinned GInteractions

When using `filter_by_overlaps()` with a PinnedGInteractions object, only the pinned anchors are used to check for overlap with `y`. This is equivalent to specifying `use.region="both"` in InteractionSet::findOverlaps().

Examples

```r
gi <- read.table(text = "
  chr1 11 20 - chr1 21 30 +
  chr1 11 20 - chr1 51 55 +
  chr1 21 30 - chr1 51 55 +
  chr1 21 30 - chr2 51 60 +",
  col.names = c("seqnames1", "start1", "end1", "strand1",
               "seqnames2", "start2", "end2", "strand2"))
  |> as_ginteractions() |> mutate(id = 1:4, type = 'gi')

gr <- GenomicRanges::GRanges(
  c("chr1:20-30:+", "chr2:55-65:-")
) |> plyranges::mutate(id = 1:2, type = 'gr')

gi

gr
```
# Find Overlaps

## Description

Find overlaps between a query GInteractions and a GRanges.

## Usage

```r
# S3 method for class 'PinnedGInteractions'
find_overlaps(x, y, maxgap = -1L, minoverlap = 0L, suffix = c(".x", ".y"))
```

```r
# S3 method for class 'GInteractions'
find_overlaps(x, y, maxgap = -1L, minoverlap = 0L, suffix = c(".x", ".y"))
```

```r
# S3 method for class 'PinnedGInteractions'
find_overlaps_directed(
    x,
    y,
    maxgap = -1L,
    minoverlap = 0L,
    suffix = c(".x", ".y")
)
```

```r
# S3 method for class 'GInteractions'
find_overlaps_directed(
```
Arguments

- `x`: A (Pinned)GIInteractions object
- `y`: A GRanges object
- `maxgap`, `minoverlap`: See `?findOverlaps` in the GenomicRanges package for a description of these arguments
- `suffix`: Suffix to add to metadata columns (character vector of length 2, default to `c(".x", ".y")`).

Value

A GIInteractions object with rows corresponding to the GIInteractions in `x` that overlap `y`.

Rationale

`find_overlaps()` will search for any overlap between GIInteractions in `x` and GRanges in `y`. It will return a GIInteractions object of length equal to the number of times `x` overlaps `y`. This GIInteractions will have additional metadata columns corresponding to the metadata from `y`. `find_overlaps_directed()` takes the strandness of each object into account.

Pinned GIInteractions

When using `find_overlaps()` with a PinnedGIInteractions object, only the pinned anchors are used to check for overlap with `y`. This is equivalent to specifying `use.region="both"` in `InteractionSet::findOverlaps()`.

Examples

```r
gi <- read.table(text = "
  chr1 11 20 - chr1 21 30 +
  chr1 11 20 - chr1 51 55 +
  chr1 21 30 - chr1 51 55 +
  chr1 21 30 - chr2 51 60 +",
  col.names = c("seqnames1", "start1", "end1", "strand1", "seqnames2", "start2", "end2", "strand2")
)
|> as_ginteractions() |> mutate(id = 1:4, type = 'gi')

gr <- GenomicRanges::GRanges(
  c("chr1:20-30:+", "chr2:55-65:-")
)
|> plyranges::mutate(id = 1:2, type = 'gr')
```
Join overlaps between a query GInteractions and a GRanges

Usage

```r
# S3 method for class 'PinnedGInteractions'
join_overlap_left(x, y, maxgap = -1L, minoverlap = 0L, suffix = c(".x", ".y"))

# S3 method for class 'GInteractions'
join_overlap_left(x, y, maxgap = -1L, minoverlap = 0L, suffix = c(".x", ".y"))

# S3 method for class 'PinnedGInteractions'
join_overlap_left_directed(
  x,
  y,
  maxgap = -1L,
  minoverlap = 0L,
  suffix = c(".x", ".y")
)
```
## S3 method for class 'GInteractions'
join_overlap_left_directed(
  x,
  y,
  maxgap = -1L,
  minoverlap = 0L,
  suffix = c(".x", ".y")
)

### Arguments

- **x**: A (Pinned)GInteractions object
- **y**: A GRanges object
- **maxgap, minoverlap**: See ?countOverlaps in the GenomicRanges package for a description of these arguments
- **suffix**: Suffix to add to metadata columns (character vector of length 2, default to c(".x", ".y").

### Value

An integer vector of same length as x.

### Examples

```r
# 1. Join overlaps between GInteractions and a subject GRanges
join_overlap_left(gi, gr)
```

```r
gi <- read.table(text = "
chr1 11 20 - chr1 21 30 +
chr1 11 20 - chr1 51 55 +
chr1 21 30 - chr1 51 55 +
chr1 21 30 - chr2 51 60 +",
col.names = c("seqnames1", "start1", "end1", "strand1",
"seqnames2", "start2", "end2", "strand2")) |> as_ginteractions() |> mutate(id = 1:4, type = 'gi')

gr <- GenomicRanges::GRanges(
c("chr1:20-30:+", "chr2:55-65:-")
) |> plyranges::mutate(id = 1:2, type = 'gr')

gi
gr

# 1. Join overlaps between GInteractions and a subject GRanges
join_overlap_left(gi, gr)
```
GM12878_HiCCUPS

join_overlap_left_directed(gi, gr)

# 2. Join overlaps between PinnedGInteractions and a subject GRanges

gi |> pin_by("first") |> join_overlap_left(gr)

gi |> pin_by("first") |> join_overlap_left_directed(gr)

gi |> pin_by("second") |> join_overlap_left(gr)

gi |> pin_by("second") |> join_overlap_left_directed(gr)

GM12878_HiCCUPS  Loops identified in GM12878 with HiCCUPS

Description

File obtained from GEO entry GSE63525 (GSE63525_GM12878_primary+replicate_HiCCUPS_looplist.txt.gz).

Usage

GM12878_HiCCUPS

Format

An object of class GInteractions of length 9448.

Value

A GInteractions object

Source

**Description**

GInteractions grouping metadata

**Usage**

```r
## S3 method for class 'GroupedGInteractions'
group_data(.data)

## S3 method for class 'GroupedGInteractions'
group_keys(.tbl, ...)

## S3 method for class 'GroupedGInteractions'
group_indices(.data, ...)

## S3 method for class 'GInteractions'
group_vars(x)

## S3 method for class 'GroupedGInteractions'
group_vars(x)

## S3 method for class 'GroupedGInteractions'
groups(x)

## S3 method for class 'GroupedGInteractions'
group_size(x)

## S3 method for class 'GroupedGInteractions'
n_groups(x)
```

**Arguments**

- `.data`, `.tbl`, `x` a GInteractions object
- `...` Ignored.

**Value**

a GInteractions object.

**Examples**

```r
gi <- read.table(text = "
chr1 11 20 chr1 21 30
chr1 11 20 chr1 51 55
"
```
```r
chr1 11 30 chr1 51 55
chr1 11 30 chr2 51 60",
col.names = c(
  "seqnames1", "start1", "end1",
  "seqnames2", "start2", "end2"
) |> as_ginteractions() |> mutate(type = c('cis', 'cis', 'cis', 'trans'), score = runif(4))

ggi <- gi |> group_by(end1)
ggi
```

---

**Usage**

- `pin(x, anchors)`
- `pin_by(x, anchors)`
- `pinned_anchors(x)`
- `unpin(x)`

## S4 method for signature 'GroupedGInteractions,character'

- `pin(x, anchors)`

## S4 method for signature 'GroupedGInteractions,numeric'

- `pin(x, anchors)`

## S4 method for signature 'GInteractions,character'

- `pin(x, anchors)`

## S4 method for signature 'GInteractions,numeric'

- `pin(x, anchors)"
```

---

**Description**

Pin GInteractions by anchors set (anchors1 or anchors2).
## S4 method for signature 'PinnedGInteractions,missing'
pin(x, anchors)

## S4 method for signature 'PinnedGInteractions,character'
pin(x, anchors)

## S4 method for signature 'PinnedGInteractions,numeric'
pin(x, anchors)

## S4 method for signature 'AnchoredPinnedGInteractions,character'
pin(x, anchors)

## S4 method for signature 'AnchoredPinnedGInteractions,numeric'
pin(x, anchors)

pin_first(x)

pin_second(x)

pin_anchors1(x)

pin_anchors2(x)

## S4 method for signature 'AnchoredPinnedGInteractions'
unpin(x)

## S4 method for signature 'PinnedGInteractions'
unpin(x)

## S4 method for signature 'GInteractions'
unpin(x)

## S4 method for signature 'PinnedGInteractions'
pinned_anchors(x)

## S4 method for signature 'AnchoredPinnedGInteractions'
pinned_anchors(x)

### Arguments

- **x**: a GInteractions object
- **anchors**: Anchors to pin on ("first" or "second")

### Value

- **pin_** functions return a PinnedGInteractions object.
- **pin** returns a numerical value indicating which set of anchors is pinned.
unpin removes the pinning of a PinnedGInteractions object.

pinned_anchors returns an (Anchored)GenomicRanges object corresponding to the pinned anchors of a PinnedGInteractions object.

Examples

```r
gi <- read.table(text = "
chr1 11 20 chr1 21 30
chr1 11 20 chr1 51 55
chr1 11 30 chr1 51 55
chr1 11 30 chr2 51 60",
col.names = c("seqnames1", "start1", "end1",
"seqnames2", "start2", "end2")
) |> as_ginteractions() |> mutate(type = c('cis', 'cis', 'cis', 'trans'), score = runif(4))
```

# 1. Pin by first anchors

```r
gi |> pin_by("first")
gi |> pin_first()
gi |> pin_anchors1()
```

# 2. Pin by second anchors

```r
gi |> pin_by("second")
gi |> pin_second()
gi |> pin_anchors2()
```

# 3. Unpin

```r
gi |> pin("second") |> unpin()
```

Generate flanking regions from pinned anchors of a GInteractions object with plyranges

Description

Generate flanking regions from pinned anchors of a GInteractions object with plyranges
Usage

flank_downstream(x, width)

## S3 method for class 'Ranges'
flank_downstream(x, width)

## S3 method for class 'PinnedGInteractions'
flank_downstream(x, width)

flank_upstream(x, width)

## S3 method for class 'Ranges'
flank_upstream(x, width)

## S3 method for class 'PinnedGInteractions'
flank_upstream(x, width)

flank_right(x, width)

## S3 method for class 'Ranges'
flank_right(x, width)

## S3 method for class 'PinnedGInteractions'
flank_right(x, width)

flank_left(x, width)

## S3 method for class 'Ranges'
flank_left(x, width)

## S3 method for class 'PinnedGInteractions'
flank_left(x, width)

Arguments

x a PinnedGInteractions object

width The width of the flanking region relative to the ranges in x. Either an integer vector of length 1 or an integer vector the same length as x. The width can be negative in which case the flanking region is reversed.

Value

A PinnedGInteractions object

Examples

```
gi <- read.table(text = "
chr1 11 20 chr1 21 30 + +
```

plyranges-shift

```
chr1 11 20 chr1 51 55 + +
chr1 11 30 chr1 51 55 - -
chr1 11 30 chr2 51 60 - -
```

col.names = c(
  "seqnames1", "start1", "end1",
  "seqnames2", "start2", "end2", "strand1", "strand2")

) |> as_ginteractions() |> mutate(score = runif(4), type = c('cis', 'cis', 'cis', 'trans'))

# 1. Simple flanking

```
# Simple flanking

gi

gi |> pin_by("first") |> flank_left(-2)

gi |> pin_by("second") |> flank_upstream(4)
```

# 2. Chained flanking of each set of anchors

```
# Chained flanking of each set of anchors

gi |
  pin_by("first") |> flank_left(2) |
  pin_by("second") |> flank_right(2)
```

---

**plyranges-shift**

*Shift pinned anchors of a GInteractions object with plyranges*

---

**Description**

Shift pinned anchors of a GInteractions object with plyranges

**Usage**

```
shift_downstream(x, shift)

## S3 method for class 'Ranges'
shift_downstream(x, shift)

## S3 method for class 'PinnedGInteractions'
shift_downstream(x, shift)

shift_upstream(x, shift)

## S3 method for class 'Ranges'
shift_upstream(x, shift)
```
## S3 method for class 'PinnedGInteractions'
shift_upstream(x, shift)

shift_right(x, shift)

## S3 method for class 'Ranges'
shift_right(x, shift)

## S3 method for class 'PinnedGInteractions'
shift_right(x, shift)

shift_left(x, shift)

## S3 method for class 'Ranges'
shift_left(x, shift)

## S3 method for class 'PinnedGInteractions'
shift_left(x, shift)

### Arguments

- **x**: a PinnedGInteractions object
- **shift**: The amount to move the genomic interval in the Ranges object by. Either a non-negative integer vector of length 1 or an integer vector the same length as x.

### Value

A PinnedGInteractions object

### Examples

```r
gi <- read.table(text = "
chr1 11 20 chr1 21 30 + + 
chr1 11 20 chr1 51 55 + + 
chr1 11 30 chr1 51 55 - - 
chr1 11 30 chr2 51 60 - -",
col.names = c(  
"seqnames1", "start1", "end1",  
"seqnames2", "start2", "end2", "strand1", "strand2")  
) |>  
as_ginteractions() |>  
mutate(score = runif(4), type = c('cis', 'cis', 'cis', 'trans'))
```

# 1. Simple shifting

```r
gi
```
plyranges-stretch

```
plyranges-stretch

# 2. Chained shifting of each set of anchors

# Gi | pin_by("first") | shift_downstream(10)
# Gi | pin_by("second") | shift_downstream(10)

plyranges-stretch

# Description

Stretch pinned anchors of a GInteractions object with plyranges

# Usage

## S3 method for class 'AnchoredPinnedGInteractions'
stretch(x, extend)

## S3 method for class 'PinnedGInteractions'
stretch(x, extend)

# Arguments

x
a PinnedGInteractions object

extend
The amount to alter the width of a Ranges object by. Either an integer vector of length 1 or an integer vector the same length as x.

# Value

A PinnedGInteractions object

# Examples

```
"chr1 11 20 chr1 21 30 + +
chr1 11 20 chr1 51 55 + +
chr1 11 30 chr1 51 55 - -
chr1 11 30 chr2 51 60 - -"

col.names = c("seqnames1", "start1", "end1",
              "seqnames2", "start2", "end2", "strand1", "strand2")

gi <- read.table(text = "

as_ginteractions() |>
```
mutate(score = runif(4), type = c('cis', 'cis', 'cis', 'trans'))

# 1. Simple stretching
#

gi

gi |> pin_by("first") |> anchor_start() |> stretch(15)

gi |> pin_by("second") |> anchor_center() |> stretch(10)

# 2. Chained stretching of each set of anchors

# 3. Re-exported objects

reexports

Objects exported from other packages

Description

These objects are imported from other packages. Follow the links below to see their documentation.

- dplyr: arrange, count, filter, group_by, group_data, group_indices, group_keys, group_rows, group_size, group_vars, groups, mutate, n_groups, rename, select, slice, summarise, summarize, tally, ungroup
- plyranges: anchor, anchor_3p, anchor_5p, anchor_center, anchor_end, anchor_start, count_overlaps, count_overlaps_directed, filter_by_non_overlaps, filter_by_overlaps, find_overlaps, find_overlaps_directed, join_overlap_left, join_overlap_left_directed, stretch, unanchor

Value

Depending on the re-exported function

Examples

1 + 1
**replace_anchors**

*Replace anchors of a GInteractions*

**Description**

Replace anchors of a GInteractions

**Usage**

```r
replace_anchors(x, id, value)
## S4 method for signature 'GInteractions,character,GenomicRanges'
replace_anchors(x, id, value)
## S4 method for signature 'GInteractions,numeric,GenomicRanges'
replace_anchors(x, id, value)
## S4 method for signature 'PinnedGInteractions,missing,GenomicRanges'
replace_anchors(x, id, value)
## S4 method for signature 'AnchoredPinnedGInteractions,missing,GRanges'
replace_anchors(x, id, value)
## S4 method for signature 'AnchoredPinnedGInteractions,numeric,GRanges'
replace_anchors(x, id, value)
```

**Arguments**

- **x**
  a (Pinned)GInteractions object

- **id**
  Which anchors to replace ("first" or "second"). Ignored if the GInteractions is already pinned to a specific set of anchors.

- **value**
  A GRanges object vector the same length as x.

**Value**

a (Pinned)GInteractions object.

**Examples**

```r
gi <- read.table(text = "
chr1 11 20 chr1 21 30
chr1 11 20 chr1 51 55
chr1 11 30 chr1 51 55
chr1 11 30 chr2 51 60",
col.names = c("seqnames1", "start1", "end1",
"seqnames2", "start2", "end2")
```
\[ \text{as_ginteractions() } |> \\
\text{mutate(type = c(’cis’, ’cis’, ’cis’, ’trans’), score = runif(4))} \]

# 1. Replace anchors of a GInteractions object

\[
\text{gi } |> \text{ replace_anchors(2, value = anchors1(gi))} \\
\text{gi } |> \text{ replace_anchors(1, value = anchors2(gi))} \\
\text{gi } |> \text{ replace_anchors(1, value = GenomicRanges::GRanges(c(} \\
\text{ “chr1:1-2”, “chr1:2-3”, “chr1:3-4”, “chr1:4-5”} \\
\text{ )))} \]

# 2. Replace anchors of a pinned GInteractions object

\[
\text{gi } |> \text{ pin_by(1) } |> \text{ replace_anchors(value = anchors1(gi))} \\
\text{gi } |> \text{ replace_anchors(1, value = anchors2(gi))} \\
\text{gi } |> \text{ pin_by(1) } |> \text{ replace_anchors(value = GenomicRanges::GRanges(c(} \\

---

**set_seqnames1**  
*Internal GInteractions setters*

**Description**  
Internal GInteractions setters

**Usage**  
set_seqnames1(x, value)  
set_seqnames2(x, value)  
set_start1(x, value)
set_seqnames1

set_start2(x, value)
set_end1(x, value)
set_end2(x, value)
set_width1(x, value)
set_width2(x, value)
set_strand1(x, value)
set_strand2(x, value)

## S4 replacement method for signature 'GInteractions'
first(x) <- value

## S4 replacement method for signature 'GInteractions'
second(x) <- value

## S4 method for signature 'GInteractions(factor'
set_seqnames1(x, value)

## S4 method for signature 'GInteractions(factor'
set_seqnames2(x, value)

## S4 method for signature 'GInteractions(numeric'
set_start1(x, value)

## S4 method for signature 'GInteractions(numeric'
set_start2(x, value)

## S4 method for signature 'GInteractions(numeric'
set_end1(x, value)

## S4 method for signature 'GInteractions(numeric'
set_end2(x, value)

## S4 method for signature 'GInteractions(numeric'
set_width1(x, value)

## S4 method for signature 'GInteractions(numeric'
set_width2(x, value)

## S4 method for signature 'AnchoredPinnedGInteractions(numeric'
set_width1(x, value)

## S4 method for signature 'AnchoredPinnedGInteractions(numeric'

set_width2(x, value)

## S4 method for signature 'GInteractions,character'
set_strand1(x, value)

## S4 method for signature 'GInteractions,character'
set_strand2(x, value)

**Arguments**

- **x**
  - a GInteractions object
- **value**
  - a value passed to the corresponding field

**Value**

A modified GInteractions
