**check_hsd**

**Value**

logical, TRUE if hsd behaving as expected

**Examples**

check_hsd()

---

**dim**

*Obtain dimensions of an object of type HSDSArraySeed*

**Description**

(required by DelayedArray seed contract) HDF server content is assumed transposed relative to R matrix layout. This anticipates H5 datasets on the server with rows for experimental samples and columns for *-omic features. The Bioconductor SummarizedExperiment requires *-omic features in rows and samples in columns.

**Usage**

```r
## S4 method for signature 'HSDSArraySeed'
dim(x)
```

**Arguments**

- `x` An object of type HSDSArraySeed

**Value**

A numeric vector of the dimensions
### dimnames

*Obtain names of dimensions for an object of type HSDSArraySeed*

**Description**

(required by DelayedArray seed contract, returns NULL list)

**Usage**

```r
## S4 method for signature 'HSDSArraySeed'
dimnames(x)
```

**Arguments**

- `x`: An object of type HSDSArraySeed

**Value**

A NULL list of length equal to the array dimensionality

### extractCompoundJSON

*compound operation*

**Description**

compound operation

**Usage**

```r
extractCompoundJSON(type, value)
```

**Arguments**

- `type`: type
- `value`: value
Access dataset backed by an HSDSArraySeed

**Description**
Access dataset backed by an HSDSArraySeed

**Usage**
```r
## S4 method for signature 'HSDSArraySeed'
extract_array(x, index)
```

**Arguments**
- `x`: An object of type HSDSArraySeed
- `index`: A list of numeric vectors to be accessed, one vector for each dimension of the array object. A NULL vector indicates the entire range of indices in that dimension. A zero-length vector indicates no indices in the relevant dimension. (Accordingly, any zero-length vector of indices will result in an empty array being returned.)

**Value**
An array containing the data elements corresponding to the indices requested

---

**getdata**
extract elements of a one or two-dimensional HSDSDataset

**Description**
Fetch data from a remote dataset

**Usage**
```r
data = HSDSDataset()
data = HSDSDataset('remote'), indices = character(1), transfermode = character(1)
data = HSDSDataset('remote'), transfermode = character(1)
data = HSDSDataset('remote'), indices = list(1)
data = HSDSDataset('remote'), transfermode = character(1)
data = HSDSDataset('remote'), indices = list(1)
data = HSDSDataset('remote'), transfermode = character(1)
```

```r
## S4 method for signature 'HSDSDataset,character,character'
getData(dataset, indices, transfermode)
## S4 method for signature 'HSDSDataset,character,missing'
getData(dataset, indices)
## S4 method for signature 'HSDSDataset,list,character'
getData(dataset, indices, transfermode)
## S4 method for signature 'HSDSDataset,list,missing'
getData(dataset, indices)
```
**Arguments**

- **dataset**: An object of type HSDSDataset, the dataset to access.
- **indices**: The indices of the data to fetch
- **transfermode**: Either 'JSON' or 'binary' (default)

**Details**

The servers require data to be fetched in slices, i.e., in sets of for which the indices of each dimension are of the form start:stop:step. More complex sets of indices will be split into slices and fetched in multiple requests. This is opaque to the user, but may enter into considerations of data access patterns, e.g., for performance-tuning.

**Value**

an Array containing the data fetched from the server

**Examples**

```r
if (check_hsds()) {
  s <- HSDSSource(URL_hsds())
  f <- HSDSFile(s, '/shared/bioconductor/patelGBMSC.h5')
  d <- HSDSDataset(f, '/assay001')
  x <- getData(d, c('1:4', '1:27998'), transfermode='JSON')
  xb <- getData(d, c('1:4', '1:27998'), transfermode='binary')
  # x <- getData(d, c(1:4, 1:27998), transfermode='JSON') # method missing?
  x
  xb
}
```
