Package ‘sparseMatrixStats’

January 26, 2024

Type Package
Title Summary Statistics for Rows and Columns of Sparse Matrices
Version 1.14.0
Description High performance functions for row and column operations on sparse matrices.
For example: col / rowMeans2, col / rowMedians, col / rowVars etc. Currently,
the optimizations are limited to data in the column sparse format.
This package is inspired by the matrixStats package by Henrik Bengtsson.
License MIT + file LICENSE
Encoding UTF-8
LazyData true
RoxygenNote 7.2.3
LinkingTo Rcpp
Imports Rcpp, Matrix, matrixStats (>= 0.60.0), methods
Depends MatrixGenerics (>= 1.5.3)
Suggests testthat (>= 2.1.0), knitr, bench, rmarkdown, BiocStyle
SystemRequirements C++11
VignetteBuilder knitr

colAlls, xgCMatrix-method

Check if all elements in a row (column) of a matrix-like object are equal to a value

Description
Check if all elements in a row (column) of a matrix-like object are equal to a value.

Usage

```r
## S4 method for signature 'xgCMatrix'
colAlls(
  x,
  rows = NULL,
  cols = NULL,
  value = TRUE,
  na.rm = FALSE,
  useNames = TRUE
)
```

```r
## S4 method for signature 'xgCMatrix'
rowAlls(
  x,
  rows = NULL,
  cols = NULL,
  value = TRUE,
  na.rm = FALSE,
  useNames = TRUE
)
```

Arguments

- **x**
  An N\times K matrix-like object.
- **rows, cols**
  A vector indicating the subset of rows (and/or columns) to operate over. If NULL, no subsetting is done.
- **value**
  The value to search for.
- **na.rm**
  If TRUE, missing values (NA or NaN) are omitted from the calculations.
- **useNames**
  If NA, the default behavior of the function about naming support is remained. If FALSE, no naming support is done. Else if TRUE, names attributes of result are set.

Details

The S4 methods for x of type matrix, array, table, or numeric call matrixStats::rowAlls / matrixStats::colAlls.
Value

Returns a logical vector of length N (K).

See Also

- matrixStats::rowAlls() and matrixStats::colAlls() which are used when the input is a matrix or numeric vector.
- For checks if any element is equal to a value, see rowAnys().
- base::all().

Examples

```r
mat <- matrix(rnorm(15), nrow = 5, ncol = 3)
mat[2, 1] <- NA
mat[3, 3] <- Inf
mat[4, 1] <- 0

print(mat)

rowAlls(mat)
colAlls(mat)
```

---

**Description**

Check if any elements in a row (column) of a matrix-like object is missing.

**Usage**

```r
## S4 method for signature 'xgCMATRIX'
colAnyNAs(x, rows = NULL, cols = NULL, useNames = TRUE)

## S4 method for signature 'xgCMATRIX'
rowAnyNAs(x, rows = NULL, cols = NULL, useNames = TRUE)
```

**Arguments**

- `x`: An NxK matrix-like object.
- `rows, cols`: A vector indicating the subset of rows (and/or columns) to operate over. If NULL, no subsetting is done.
- `useNames`: If NA, the default behavior of the function about naming support is remained. If FALSE, no naming support is done. Else if TRUE, names attributes of result are set.
Details

The S4 methods for x of type matrix, array, table, or numeric call matrixStats::rowAnyNAs / matrixStats::colAnyNAs.

Value

Returns a logical vector of length N (K).

See Also

- matrixStats::rowAnyNAs() and matrixStats::colAnyNAs() which are used when the input is a matrix or numeric vector.
- For checks if any element is equal to a value, see rowAnys().
- base::is.na() and base::any().

Examples

```r
mat <- matrix(0, nrow=10, ncol=5)
mat[sample(seq_len(5 *10), 5)] <- NA
sp_mat <- as(mat, "dgCMatrix")
colAnyNAs(sp_mat)
```

Description

Check if any elements in a row (column) of a matrix-like object is equal to a value.

Usage

```r
## S4 method for signature 'xgCMatrix'
colAnys(
  x,
  rows = NULL,
  cols = NULL,
  value = TRUE,
  na.rm = FALSE,
  useNames = TRUE
)

## S4 method for signature 'xgCMatrix'
rowAnys(
  x,

```
Arguments

x            An NxK matrix-like object.
rows, cols   A vector indicating the subset of rows (and/or columns) to operate over. If NULL, no subsetting is done.
value        The value to search for.
na.rm        If TRUE, missing values (NA or NaN) are omitted from the calculations.
useNames     If NA, the default behavior of the function about naming support is remained. If FALSE, no naming support is done. Else if TRUE, names attributes of result are set.

Details

The S4 methods for x of type matrix, array, table, or numeric call matrixStats::rowAnys / matrixStats::colAnys.

Value

Returns a logical vector of length N (K).

See Also

- matrixStats::rowAnys() and matrixStats::colAnys() which are used when the input is a matrix or numeric vector.
- For checks if all elements are equal to a value, see rowAlls().
- base::any().

Examples

```r
mat <- matrix(rnorm(15), nrow = 5, ncol = 3)
mat[2, 1] <- NA
mat[3, 3] <- Inf
mat[4, 1] <- 0

print(mat)

rowAnys(mat)
colAnys(mat)
```
Calculates for each row (column) a summary statistic for equally sized subsets of columns (rows)

Description

Calculates for each row (column) a summary statistic for equally sized subsets of columns (rows)

Usage

```r
## S4 method for signature 'xgCMatrix'
colAvgsPerRowSet(
  X,
  W = NULL,
  cols = NULL,
  S,
  FUN = colMeans2,
  ..., 
  na.rm = NA,
  tFUN = FALSE
)

## S4 method for signature 'xgCMatrix'
rowAvgsPerColSet(
  X,
  W = NULL,
  rows = NULL,
  S,
  FUN = rowMeans2,
  ..., 
  na.rm = NA,
  tFUN = FALSE
)
```

Arguments

- **X**
  An N\times M matrix-like object.

- **W**
  An optional numeric N\times M matrix of weights.

- **S**
  An integer K\times J matrix that specifying the J subsets. Each column hold K column (row) indices for the corresponding subset. The range of values is [1, M] ([1,N]).

- **FUN**
  A row-by-row (column-by-column) summary statistic function. It is applied to to each column (row) subset of X that is specified by S.

- **...**
  Additional arguments passed to FUN.

- **na.rm**
  (logical) Argument passed to FUN() as na.rm = na.rm. If NA (default), then na.rm = TRUE is used if X or S holds missing values, otherwise na.rm = FALSE.
**colCollapse.xgCMATRIX-method**

*Extract one cell from each row (column) of a matrix-like object*

**Description**

Extract one cell from each row (column) of a matrix-like object.

**Usage**

```r
## S4 method for signature 'xgCMATRIX'
colCollapse(x, idxs, cols = NULL, useNames = TRUE)

## S4 method for signature 'xgCMATRIX'
rowCollapse(x, idxs, rows = NULL, useNames = TRUE)
```

---

**tFUN**

If TRUE, X is transposed before it is passed to FUN.

**rows, cols**

A vector indicating the subset (and/or columns) to operate over. If NULL, no subsetting is done.

**Details**

**Note**: the handling of missing parameters differs from `matrixStats::colAvgsPerRowSet()`.

The 'matrixStats' version always removes 'NA' if there are any in the data. This method however does whatever is passed in the '...' parameter.

**Value**

Returns a numeric JxN (MxJ) matrix.

**See Also**

• `matrixStats::rowAvgsPerColSet()` and `matrixStats::colAvgsPerRowSet()` which are used when the input is a matrix or numeric vector.

**Examples**

```r
mat <- matrix(rnorm(20), nrow = 5, ncol = 4)
mat[2, 1] <- NA
mat[3, 3] <- Inf
mat[4, 1] <- 0

print(mat)

S <- matrix(1:ncol(mat), ncol = 2)
print(S)

rowAvgsPerColSet(mat, S = S, FUN = rowMeans)
rowAvgsPerColSet(mat, S = S, FUN = rowVars)
```
Arguments

- **x**: An NxK matrix-like object.
- **idxs**: An index vector with the position to extract. It is recycled to match the number of rows (column).
- **useNames**: If NA, the default behavior of the function about naming support is remained. If FALSE, no naming support is done. Else if TRUE, names attributes of result are set.
- **rows, cols**: A vector indicating the subset of rows (and/or columns) to operate over. If NULL, no subsetting is done.

Details

The S4 methods for x of type matrix, array, table, or numeric call matrixStats::rowCollapse / matrixStats::colCollapse.

Value

Returns a numeric vector of length N (K).

See Also

- matrixStats::rowCollapse() and matrixStats::colCollapse() which are used when the input is a matrix or numeric vector.

Examples

```
mat <- matrix(rnorm(15), nrow = 5, ncol = 3)
mat[2, 1] <- NA
mat[3, 3] <- Inf
mat[4, 1] <- 0

print(mat)

rowCollapse(mat, idxs = 2)
rowCollapse(mat, idxs = c(1,1,2,3,2))

colCollapse (mat, idxs = 4)
```

Description

Count how often an element in a row (column) of a matrix-like object is equal to a value.
Usage

## S4 method for signature 'xgCMatrix'
colCounts(
  x,
  rows = NULL,
  cols = NULL,
  value = TRUE,
  na.rm = FALSE,
  useNames = TRUE
)

## S4 method for signature 'xgCMatrix'
rowCounts(
  x,
  rows = NULL,
  cols = NULL,
  value = TRUE,
  na.rm = FALSE,
  useNames = TRUE
)

Arguments

x          An NxK matrix-like object.
rows, cols A vector indicating the subset of rows (and/or columns) to operate over. If NULL, no subsetting is done.
value      The value to search for.
na.rm      If TRUE, missing values (NA or NaN) are omitted from the calculations.
useNames   If NA, the default behavior of the function about naming support is remained. If FALSE, no naming support is done. Else if TRUE, names attributes of result are set.

Details

The S4 methods for x of type matrix, array, table, or numeric call matrixStats::rowCounts / matrixStats::colCounts.

Value

Returns a integer vector of length N (K).

See Also

- matrixStats::rowCounts() and matrixStats::colCounts() which are used when the input is a matrix or numeric vector.
- For checks if any element is equal to a value, see rowAnys(). To check if all elements are equal, see rowAlls().
Examples

```r
mat <- matrix(rnorm(15), nrow = 5, ncol = 3)
mat[2, 1] <- NA
mat[3, 3] <- Inf
mat[4, 1] <- 0

print(mat)
rowCounts(mat)
colCounts(mat)
  rowCounts(mat, value = 0)
colCounts(mat, value = Inf, na.rm = TRUE)
```

Description

Calculates the cumulative maxima for each row (column) of a matrix-like object.

Usage

```r
## S4 method for signature 'dgCMatrix'
colCummaxs(x, rows = NULL, cols = NULL, useNames = TRUE)

## S4 method for signature 'dgCMatrix'
rowCummaxs(x, rows = NULL, cols = NULL, useNames = TRUE)
```

Arguments

- `x` An NxK matrix-like object.
- `rows`, `cols` A vector indicating the subset of rows (and/or columns) to operate over. If NULL, no subsetting is done.
- `useNames` If NA, the default behavior of the function about naming support is remained. If FALSE, no naming support is done. Else if TRUE, names attributes of result are set.

Details

The S4 methods for `x` of type `matrix`, `array`, `table`, or `numeric` call `matrixStats::rowCummaxs` / `matrixStats::colCummaxs`.

Value

Returns a numeric matrix with the same dimensions as `x`. 

See Also

- `matrixStats::rowCummaxs()` and `matrixStats::colCummaxs()` which are used when the input is a matrix or numeric vector.
- For single maximum estimates, see `rowMaxs()`.
- `base::cummax()`.

Examples

```r
mat <- matrix(rnorm(15), nrow = 5, ncol = 3)
mat[2, 1] <- NA
mat[3, 3] <- Inf
mat[4, 1] <- 0

print(mat)
rowCummaxs(mat)
colCummaxs(mat)
```

Calculates the cumulative minima for each row (column) of a matrix-like object

Description

Calculates the cumulative minima for each row (column) of a matrix-like object.

Usage

```r
## S4 method for signature 'dgCMatrix'
colCummins(x, rows = NULL, cols = NULL, useNames = TRUE)

## S4 method for signature 'dgCMatrix'
rowCummins(x, rows = NULL, cols = NULL, useNames = TRUE)
```

Arguments

- **x**: An NxK matrix-like object.
- **rows, cols**: A `vector` indicating the subset of rows (and/or columns) to operate over. If `NULL`, no subsetting is done.
- **useNames**: If `NA`, the default behavior of the function about naming support is remained. If `FALSE`, no naming support is done. Else if `TRUE`, names attributes of result are set.

Details

The S4 methods for `x` of type `matrix, array, table, or numeric` call `matrixStats::rowCummins` / `matrixStats::colCummins`. 
Value

Returns a numeric matrix with the same dimensions as \( x \).

See Also

- `matrixStats::rowCummins()` and `matrixStats::colCummins()` which are used when the input is a matrix or numeric vector.
- For single minimum estimates, see `rowMins()`.
- `base::cummin()`.

Examples

```r
mat <- matrix(rnorm(15), nrow = 5, ncol = 3)
mat[2, 1] <- NA
mat[3, 3] <- Inf
mat[4, 1] <- 0

print(mat)
rowCummins(mat)
colCummins(mat)
```
Details

The S4 methods for `x` of type `matrix, array, table, or numeric` call `matrixStats::rowCumprods` / `matrixStats::colCumprods`.

Value

Returns a numeric matrix with the same dimensions as `x`.

See Also

- `matrixStats::rowCumprods()` and `matrixStats::colCumprods()` which are used when the input is a matrix or numeric vector.
- `base::cumprod()`.

Examples

```r
mat <- matrix(rnorm(15), nrow = 5, ncol = 3)
m[2, 1] <- NA
m[3, 3] <- Inf
m[4, 1] <- 0

print(m)
rowCumprods(m)
colCumprods(m)
```

---

**colCumsums.xgCMatrix-method**

Calculates the cumulative sum for each row (column) of a matrix-like object

Description

Calculates the cumulative sum for each row (column) of a matrix-like object.

Usage

```r
## S4 method for signature 'xgCMatrix'
colCumsums(x, rows = NULL, cols = NULL, useNames = TRUE)

## S4 method for signature 'xgCMatrix'
rowCumsums(x, rows = NULL, cols = NULL, useNames = TRUE)
```
colDiffs.dgCMatrix-method

Arguments

- **x**: An NxK matrix-like object.
- **rows, cols**: A vector indicating the subset of rows (and/or columns) to operate over. If NULL, no subsetting is done.
- **useNames**: If NA, the default behavior of the function about naming support is remained. If FALSE, no naming support is done. Else if TRUE, names attributes of result are set.

Details

The S4 methods for x of type matrix, array, table, or numeric call matrixStats::rowCumsums / matrixStats::colCumsums.

Value

Returns a numeric matrix with the same dimensions as x.

See Also

- matrixStats::rowCumsums() and matrixStats::colCumsums() which are used when the input is a matrix or numeric vector.
- base::cumsum().

Examples

```r
mat <- matrix(rnorm(15), nrow = 5, ncol = 3)
mat[2, 1] <- NA
mat[3, 3] <- Inf
mat[4, 1] <- 0

print(mat)

rowCumsums(mat)
colCumsums(mat)
```

Description

Calculates the difference between each element of a row (column) of a matrix-like object.
Usage

```
## S4 method for signature 'dgCMatrix'
colDiffs(
  x,
  rows = NULL,
  cols = NULL,
  lag = 1L,
  differences = 1L,
  useNames = TRUE
)
```

```
## S4 method for signature 'dgCMatrix'
rowDiffs(
  x,
  rows = NULL,
  cols = NULL,
  lag = 1L,
  differences = 1L,
  useNames = TRUE
)
```

Arguments

- `x`: An N \times K matrix-like object.
- `rows, cols`: A vector indicating the subset of rows (and/or columns) to operate over. If `NULL`, no subsetting is done.
- `lag`: An integer specifying the lag.
- `differences`: An integer specifying the order of difference.
- `useNames`: If `NA`, the default behavior of the function about naming support is remained. If `FALSE`, no naming support is done. Else if `TRUE`, names attributes of result are set.

Details

The S4 methods for `x` of type `matrix, array, table, or numeric` call `matrixStats::rowDiffs / matrixStats::colDiffs`.

Value

Returns a numeric matrix with one column (row) less than `x`: \( N(K - 1) \) or \( (N - 1) \times K \).

See Also

- `matrixStats::rowDiffs()` and `matrixStats::colDiffs()` which are used when the input is a matrix or numeric vector.
- `base::diff()`.
Examples

```r
mat <- matrix(rnorm(15), nrow = 5, ncol = 3)
mat[2, 1] <- NA
mat[3, 3] <- Inf
mat[4, 1] <- 0

print(mat)
rowDiffs(mat)
colDiffs(mat)
```

Description

Calculates the interquartile range of the difference between each element of a row (column) of a matrix-like object.

Usage

```r
## S4 method for signature 'dgCMatrix'
colIQRDiffs(
  x,
  rows = NULL,
  cols = NULL,
  na.rm = FALSE,
  diff = 1L,
  trim = 0,
  useNames = TRUE
)

## S4 method for signature 'dgCMatrix'
rowIQRDiffs(
  x,
  rows = NULL,
  cols = NULL,
  na.rm = FALSE,
  diff = 1L,
  trim = 0,
  useNames = TRUE
)
```
Arguments

- **x**: An NxK matrix-like object.
- **rows, cols**: A vector indicating the subset of rows (and/or columns) to operate over. If `NULL`, no subsetting is done.
- **na.rm**: If TRUE, missing values (NA or NaN) are omitted from the calculations.
- **diff**: An integer specifying the order of difference.
- **trim**: A double in [0,1/2] specifying the fraction of observations to be trimmed from each end of (sorted) x before estimation.
- **useNames**: If NA, the default behavior of the function about naming support is remained. If FALSE, no naming support is done. Else if TRUE, names attributes of result are set.

Details

The S4 methods for x of type matrix, array, table, or numeric call matrixStats::rowIQRDiffs / matrixStats::colIQRDiffs.

Value

Returns a numeric vector of length N (K).

See Also

- matrixStats::rowIQRDiffs() and matrixStats::colIQRDiffs() which are used when the input is a matrix or numeric vector.
- For the direct interquartile range see also rowIQRs.

Examples

```r
mat <- matrix(rnorm(15), nrow = 5, ncol = 3)
mat[2, 1] <- NA
mat[3, 3] <- Inf
mat[4, 1] <- 0

print(mat)
rowIQRDiffs(mat)
colIQRDiffs(mat)
```
colIQRs, xgCMatrix-method

Calculates the interquartile range for each row (column) of a matrix-like object

Description

Calculates the interquartile range for each row (column) of a matrix-like object.

Usage

## S4 method for signature 'xgCMatrix'
colIQRs(x, rows = NULL, cols = NULL, na.rm = FALSE, useNames = TRUE)

## S4 method for signature 'xgCMatrix'
rowIQRs(x, rows = NULL, cols = NULL, na.rm = FALSE, useNames = TRUE)

Arguments

- **x**: An NxK matrix-like object.
- **rows, cols**: A vector indicating the subset of rows (and/or columns) to operate over. If NULL, no subsetting is done.
- **na.rm**: If TRUE, missing values (NA or NaN) are omitted from the calculations.
- **useNames**: If NA, the default behavior of the function about naming support is remained. If FALSE, no naming support is done. Else if TRUE, names attributes of result are set.

Details

The S4 methods for x of type matrix, array, table, or numeric call matrixStats::rowIQRs / matrixStats::colIQRs.

Value

Returns a numeric vector of length N (K).

See Also

- matrixStats::rowIQRs() and matrixStats::colIQRs() which are used when the input is a matrix or numeric vector.
- For a non-robust analog, see rowSds(). For a more robust version see rowMads().
- stats::IQR().
Examples

```r
mat <- matrix(rnorm(15), nrow = 5, ncol = 3)
mat[2, 1] <- NA
mat[3, 3] <- Inf
mat[4, 1] <- 0

print(mat)
rowIQRs(mat)
colIQRs(mat)
```

Description

Accurately calculates the logarithm of the sum of exponentials for each row (column) of a matrix-like object.

Usage

```r
## S4 method for signature 'xgCMatrix'
colLogSumExps(lx, rows = NULL, cols = NULL, na.rm = FALSE, useNames = TRUE)
```

Arguments

- `lx` An NxK matrix-like object. Typically `lx` are log(x) values.
- `rows, cols` A vector indicating the subset (and/or columns) to operate over. If `NULL`, no subsetting is done.
- `na.rm` If `TRUE`, missing values (NA or NaN) are omitted from the calculations.
- `useNames` If `NA`, the default behavior of the function about naming support is remained. If `FALSE`, no naming support is done. Else if `TRUE`, names attributes of result are set.

Details

The S4 methods for `x` of type `matrix, array, table, or numeric` call `matrixStats::rowLogSumExps` / `matrixStats::colLogSumExps`.

Value

Returns a numeric vector of length N (K).
See Also

- `matrixStats::rowLogSumExps()` and `matrixStats::colLogSumExps()` which are used when the input is a matrix or numeric vector.
- `rowSums2()`

Examples

```r
mat <- matrix(rnorm(15), nrow = 5, ncol = 3)
mat[2, 1] <- NA
mat[3, 3] <- Inf
mat[4, 1] <- 0

print(mat)
rowLogSumExps(mat)
colLogSumExps(mat)
```

```r

colMadDiffs, dgCMatix-method
Calculates the mean absolute deviation of the difference between each element of a row (column) of a matrix-like object

Description

Calculates the mean absolute deviation of the difference between each element of a row (column) of a matrix-like object.

Usage

```r
## S4 method for signature 'dgCMatrix'
colMadDiffs(
x,
rows = NULL,
cols = NULL,
na.rm = FALSE,
diff = 1L,
trim = 0,
constant = 1.4826,
..., 
useNames = TRUE
)

## S4 method for signature 'dgCMatrix'
rowMadDiffs(
x,
rows = NULL,
cols = NULL,
```
Arguments

- **x**
  - An NxK matrix-like object.

- **rows, cols**
  - A vector indicating the subset of rows (and/or columns) to operate over. If NULL, no subsetting is done.

- **na.rm**
  - If TRUE, missing values (NA or NaN) are omitted from the calculations.

- **diff**
  - An integer specifying the order of difference.

- **trim**
  - A double in [0,1/2] specifying the fraction of observations to be trimmed from each end of (sorted) x before estimation.

- **constant**
  - A scale factor. See mad for details.

- **...**
  - Additional arguments passed to specific methods.

- **useNames**
  - If NA, the default behavior of the function about naming support is remained. If FALSE, no naming support is done. Else if TRUE, names attributes of result are set.

Details

The S4 methods for x of type matrix, array, table, or numeric call matrixStats::rowMadDiffs / matrixStats::colMadDiffs.

Value

Returns a numeric vector of length N (K).

See Also

- matrixStats::rowMadDiffs() and matrixStats::colMadDiffs() which are used when the input is a matrix or numeric vector.

Examples

```r
mat <- matrix(rnorm(15), nrow = 5, ncol = 3)
mat[2, 1] <- NA
mat[3, 3] <- Inf
mat[4, 1] <- 0

print(mat)
rowMadDiffs(mat)
colMadDiffs(mat)
```
colMads.dgCMatrix-method

Calculates the median absolute deviation for each row (column) of a matrix-like object

Description

Calculates the median absolute deviation for each row (column) of a matrix-like object.

Usage

```r
## S4 method for signature 'dgCMatrix'
colMads(
  x,
  rows = NULL,
  cols = NULL,
  center = NULL,
  constant = 1.4826,
  na.rm = FALSE,
  useNames = TRUE
)

## S4 method for signature 'dgCMatrix'
rowMads(
  x,
  rows = NULL,
  cols = NULL,
  center = NULL,
  constant = 1.4826,
  na.rm = FALSE,
  useNames = TRUE
)
```

Arguments

- `x` An NxK matrix-like object.
- `rows, cols` A `vector` indicating the subset of rows (and/or columns) to operate over. If `NULL`, no subsetting is done.
- `center` (optional) the center, defaults to the row means
- `constant` A scale factor. See `stats::mad()` for details.
- `na.rm` If `TRUE`, missing values (NA or NaN) are omitted from the calculations.
- `useNames` If NA, the default behavior of the function about naming support is remained. If FALSE, no naming support is done. Else if TRUE, names attributes of result are set.
Details

The S4 methods for x of type `matrix`, `array`, `table`, or `numeric` call `matrixStats::rowMads` / `matrixStats::colMads`.

Value

Returns a numeric vector of length N (K).

See Also

- `matrixStats::rowMads()` and `matrixStats::colMads()` which are used when the input is a matrix or numeric vector.
- For mean estimates, see `rowMeans2()` and `rowMeans()`.
- For non-robust standard deviation estimates, see `rowSds()`.

Examples

```r
mat <- matrix(rnorm(15), nrow = 5, ncol = 3)
mat[2, 1] <- NA
mat[3, 3] <- Inf
mat[4, 1] <- 0
print(mat)
rowMads(mat)
colMads(mat)
```

---

colMaxs.dgCMatrix-method

*Calculates the maximum for each row (column) of a matrix-like object*

Description

Calculates the maximum for each row (column) of a matrix-like object.

Usage

```r
## S4 method for signature 'dgCMatrix'
colMaxs(x, rows = NULL, cols = NULL, na.rm = FALSE, useNames = TRUE)
```

```r
## S4 method for signature 'dgCMatrix'
rowMaxs(x, rows = NULL, cols = NULL, na.rm = FALSE, useNames = TRUE)
```
Arguments

- **x**: An NxK matrix-like object.
- **rows, cols**: A vector indicating the subset of rows (and/or columns) to operate over. If NULL, no subsetting is done.
- **na.rm**: If TRUE, missing values (NA or NaN) are omitted from the calculations.
- **useNames**: If NA, the default behavior of the function about naming support is remained. If FALSE, no naming support is done. Else if TRUE, names attributes of result are set.

Details

The S4 methods for x of type matrix, array, table, or numeric call matrixStats::rowMaxs / matrixStats::colMaxs.

Value

Returns a numeric vector of length N (K).

See Also

- matrixStats::rowMaxs() and matrixStats::colMaxs() which are used when the input is a matrix or numeric vector.
- For min estimates, see rowMins().

Examples

```
mat <- matrix(rnorm(15), nrow = 5, ncol = 3)
mat[2, 1] <- NA
mat[3, 3] <- Inf
mat[4, 1] <- 0

print(mat)
rowMaxs(mat)
colMaxs(mat)
```

---

**Description**

Calculates the mean for each row (column) of a matrix-like object.
Usage

```r
## S4 method for signature 'xgCMatrix'
colMeans2(x, rows = NULL, cols = NULL, na.rm = FALSE, useNames = TRUE)

## S4 method for signature 'xgCMatrix'
rowMeans2(x, rows = NULL, cols = NULL, na.rm = FALSE, useNames = TRUE)
```

Arguments

- `x`: An NxK matrix-like object.
- `rows, cols`: A vector indicating the subset of rows (and/or columns) to operate over. If NULL, no subsetting is done.
- `na.rm`: If TRUE, missing values (NA or NaN) are omitted from the calculations.
- `useNames`: If NA, the default behavior of the function about naming support is remained. If FALSE, no naming support is done. Else if TRUE, names attributes of result are set.

Details

The S4 methods for x of type matrix, array, table, or numeric call matrixStats::rowMeans2 / matrixStats::colMeans2.

Value

Returns a numeric vector of length N (K).

See Also

- matrixStats::rowMeans2() and matrixStats::colMeans2() which are used when the input is a matrix or numeric vector.
- See also rowMeans() for the corresponding function in base R.
- For variance estimates, see rowVars().
- See also the base R version base::rowMeans().

Examples

```r
mat <- matrix(rnorm(15), nrow = 5, ncol = 3)
mat[2, 1] <- NA
mat[3, 3] <- Inf
mat[4, 1] <- 0

print(mat)
rowMeans2(mat)
colMeans2(mat)
```
colMedians.dgCMatrix-method

Calculates the median for each row (column) of a matrix-like object

Description

Calculates the median for each row (column) of a matrix-like object.

Usage

## S4 method for signature 'dgCMatrix'
colMedians(x, rows = NULL, cols = NULL, na.rm = FALSE, useNames = TRUE)

## S4 method for signature 'dgCMatrix'
rowMedians(x, rows = NULL, cols = NULL, na.rm = FALSE, useNames = TRUE)

Arguments

- **x**: An N\times K matrix-like object.
- **rows, cols**: A vector indicating the subset of rows (and/or columns) to operate over. If NULL, no subsetting is done.
- **na.rm**: If TRUE, missing values (NA or NaN) are omitted from the calculations.
- **useNames**: If NA, the default behavior of the function about naming support is remained. If FALSE, no naming support is done. Else if TRUE, names attributes of result are set.

Details

The S4 methods for x of type matrix, array, table, or numeric call matrixStats::rowMedians / matrixStats::colMedians.

Value

Returns a numeric vector of length N (K).

See Also

- matrixStats::rowMedians() and matrixStats::colMedians() which are used when the input is a matrix or numeric vector.
- For mean estimates, see rowMeans2() and rowMeans().
Examples

```r
mat <- matrix(rnorm(15), nrow = 5, ncol = 3)
mat[2, 1] <- NA
mat[3, 3] <- Inf
mat[4, 1] <- 0

print(mat)
rowMedians(mat)
colMedians(mat)
```

### colMins,dgCMatrix-method

*Calculates the minimum for each row (column) of a matrix-like object*

### Description

Calculates the minimum for each row (column) of a matrix-like object.

### Usage

```r
## S4 method for signature 'dgCMatrix'
colMins(x, rows = NULL, cols = NULL, na.rm = FALSE, useNames = TRUE)
## S4 method for signature 'dgCMatrix'
rowMins(x, rows = NULL, cols = NULL, na.rm = FALSE, useNames = TRUE)
```

### Arguments

- **x**
  - An NxK matrix-like object.
- **rows, cols**
  - A *vector* indicating the subset of rows (and/or columns) to operate over. If *NULL*, no subsetting is done.
- **na.rm**
  - If *TRUE*, missing values (NA or NaN) are omitted from the calculations.
- **useNames**
  - If *NA*, the default behavior of the function about naming support is remained. If *FALSE*, no naming support is done. Else if *TRUE*, names attributes of result are set.

### Details

The S4 methods for `x` of type `matrix, array, table, or numeric` call `matrixStats::rowMins` / `matrixStats::colMins`.

### Value

Returns a *numeric vector* of length N (K).
See Also

- `matrixStats::rowMins()` and `matrixStats::colMins()` which are used when the input is a matrix or numeric vector.
- For max estimates, see `rowMaxs()`.

Examples

```r
mat <- matrix(rnorm(15), nrow = 5, ncol = 3)
mat[2, 1] <- NA
mat[3, 3] <- Inf
mat[4, 1] <- 0

print(mat)
rowMins(mat)
colMins(mat)
```

```
colOrderStats,dgCMatrix-method

Calculates an order statistic for each row (column) of a matrix-like object

Description

Calculates an order statistic for each row (column) of a matrix-like object.

Usage

```r
## S4 method for signature 'dgCMatrix'
colOrderStats(
  x,
  rows = NULL,
  cols = NULL,
  which = 1,
  na.rm = FALSE,
  useNames = TRUE
)
```

```r
## S4 method for signature 'dgCMatrix'
rowOrderStats(
  x,
  rows = NULL,
  cols = NULL,
  which = 1,
  na.rm = FALSE,
  useNames = TRUE
)
```
Arguments

- **x** An NxK matrix-like object.
- **rows, cols** A vector indicating the subset of rows (and/or columns) to operate over. If **NULL**, no subsetting is done.
- **which** An integer index in [1,K] ([1,N]) indicating which order statistic to be returned.
- **na.rm** If TRUE, NAs are excluded first, otherwise not.
- **useNames** If NA, the default behavior of the function about naming support is remained. If FALSE, no naming support is done. Else if TRUE, names attributes of result are set.

Details

The S4 methods for x of type matrix, array, table, or numeric call matrixStats::rowOrderStats / matrixStats::colOrderStats.

Value

Returns a numeric vector of length N (K).

See Also

- matrixStats::rowOrderStats() and matrixStats::colOrderStats() which are used when the input is a matrix or numeric vector.

Examples

```r
mat <- matrix(rnorm(15), nrow = 5, ncol = 3)
mat[2, 1] <- 2
mat[3, 3] <- Inf
mat[4, 1] <- 0
print(mat)
rowOrderStats(mat, which = 1)
colOrderStats(mat, which = 3)
```
Usage

```r
## S4 method for signature 'xgCMatrix'
colProds(x, rows = NULL, cols = NULL, na.rm = FALSE, useNames = TRUE)

## S4 method for signature 'xgCMatrix'
rowProds(x, rows = NULL, cols = NULL, na.rm = FALSE, useNames = TRUE)
```

Arguments

- **x**: An NxK matrix-like object.
- **rows, cols**: A vector indicating the subset of rows (and/or columns) to operate over. If NULL, no subsetting is done.
- **na.rm**: If TRUE, missing values (NA or NaN) are omitted from the calculations.
- **useNames**: If NA, the default behavior of the function about naming support is remained. If FALSE, no naming support is done. Else if TRUE, names attributes of result are set.

Details

Attention: This method ignores the order of the values, because it assumes that the product is commutative. Unfortunately, for 'double' this is not true. For example 'NaN * NA = NaN', but 'NA * NaN = NA'. This is relevant for this function if there are '+-Inf', because 'Inf * 0 = NaN'. This function returns 'NA' whenever there is 'NA' in the input. This is different from 'matrixStats::colProds()'.

Value

Returns a numeric vector of length N (K).

See Also

- matrixStats::rowProds() and matrixStats::colProds() which are used when the input is a matrix or numeric vector.
- For sums across rows (columns), see rowSums2() (colSums2())
- base::prod().

Examples

```r
mat <- matrix(rnorm(15), nrow = 5, ncol = 3)
mat[2, 1] <- NA
mat[3, 3] <- Inf
mat[4, 1] <- 0
print(mat)
rowProds(mat)
colProds(mat)
```
Description

Calculates quantiles for each row (column) of a matrix-like object.

Usage

```r
## S4 method for signature 'xgCMatrix'
colQuantiles(
x, 
rows = NULL, 
cols = NULL, 
probs = seq(from = 0, to = 1, by = 0.25), 
na.rm = FALSE, 
type = 7L, 
useNames = TRUE, 
drop = TRUE
)
```

```r
## S4 method for signature 'xgCMatrix'
rowQuantiles(
x, 
rows = NULL, 
cols = NULL, 
probs = seq(from = 0, to = 1, by = 0.25), 
na.rm = FALSE, 
type = 7L, 
useNames = TRUE, 
drop = TRUE
)
```

Arguments

- `x` An N×K matrix-like object.
- `rows, cols` A vector indicating the subset of rows (and/or columns) to operate over. If `NULL`, no subsetting is done.
- `probs` A numeric vector of J probabilities in [0, 1].
- `na.rm` If `TRUE`, missing values (NA or NaN) are omitted from the calculations.
- `type` An integer specifying the type of estimator. See `stats::quantile()` for more details.
- `useNames` If `NA`, the default behavior of the function about naming support is remained. If `FALSE`, no naming support is done. Else if `TRUE`, names attributes of result are set.
Details

The S4 methods for \( x \) of type \texttt{matrix, array, table, or numeric} call \texttt{matrixStats::rowQuantiles} / \texttt{matrixStats::colQuantiles}.

Value

a \texttt{numeric} \( N \times J \) (\( K \times J \)) \texttt{matrix}, where \( N \) (\( K \)) is the number of rows (columns) for which the \( J \) values are calculated.

See Also

- \texttt{matrixStats::rowQuantiles()} and \texttt{matrixStats::colQuantiles()} which are used when the input is a matrix or numeric vector.
- \texttt{stats::quantile}

Examples

```r
mat <- matrix(rnorm(15), nrow = 5, ncol = 3)
mat[2, 1] <- NA
mat[3, 3] <- Inf
mat[4, 1] <- 0

print(mat)
rowQuantiles(mat)
colQuantiles(mat)
```

Description

Calculates the minimum and maximum for each row (column) of a matrix-like object.

Usage

```r
## S4 method for signature 'dgCMatrix'
colRanges(x, rows = NULL, cols = NULL, na.rm = FALSE, useNames = TRUE)

## S4 method for signature 'dgCMatrix'
rowRanges(x, rows = NULL, cols = NULL, na.rm = FALSE, useNames = TRUE)
```
Arguments

- **x**: An NxK matrix-like object.
- **rows, cols**: A vector indicating the subset of rows (and/or columns) to operate over. If NULL, no subsetting is done.
- **na.rm**: If TRUE, missing values (NA or NaN) are omitted from the calculations.
- **useNames**: If NA, the default behavior of the function about naming support is remained. If FALSE, no naming support is done. Else if TRUE, names attributes of result are set.

Details

The S4 methods for x of type matrix, array, table, or numeric call matrixStats::rowRanges / matrixStats::colRanges.

Value

A numeric Nx2 (Kx2) matrix, where N (K) is the number of rows (columns) for which the ranges are calculated.

Note

Unfortunately for the argument list of the rowRanges() generic function we cannot follow the scheme used for the other row/column matrix summarization generic functions. This is because we need to be compatible with the historic rowRanges() getter for RangedSummarizedExperiment objects. See ?SummarizedExperiment::rowRanges.

See Also

- matrixStats::rowRanges() and matrixStats::colRanges() which are used when the input is a matrix or numeric vector.
- For max estimates, see rowMaxs().
- For min estimates, see rowMins().
- base::range().

Examples

```r
mat <- matrix(rnorm(15), nrow = 5, ncol = 3)
mat[2, 1] <- NA
mat[3, 3] <- Inf
mat[4, 1] <- 0
print(mat)
rowRanges(mat)
colRanges(mat)
```
**Description**

Calculates the rank of the elements for each row (column) of a matrix-like object.

**Usage**

```r
## S4 method for signature 'dgCMatrix'
colRanks(
  x,
  rows = NULL,
  cols = NULL,
  ties.method = c("max", "average", "min"),
  preserveShape = FALSE,
  na.handling = c("keep", "last"),
  ..., 
  useNames = TRUE
)
```

```r
## S4 method for signature 'dgCMatrix'
rowRanks(
  x,
  rows = NULL,
  cols = NULL,
  ties.method = c("max", "average", "min"),
  preserveShape = TRUE,
  na.handling = c("keep", "last"),
  ..., 
  useNames = TRUE
)
```

**Arguments**

- **x**: An NxK matrix-like object.
- **rows, cols**: A vector indicating the subset of rows (and/or columns) to operate over. If `NULL`, no subsetting is done.
- **ties.method**: A character string specifying how ties are treated. Note that the default specifies fewer options than the original matrixStats package.
- **preserveShape**: a boolean that specifies if the returned matrix has the same dimensions as the input matrix. By default this is true for `rowRanks()`, but false for `colRanks()`.
na.handling string specifying how ‘NA’ s are handled. They can either be preserved with an ‘NA’ rank (‘keep’) or sorted in at the end (‘last’). Default is ‘keep’ derived from the behavior of the equivalent

Additional arguments passed to specific methods.

useNames If NA, the default behavior of the function about naming support is remained. If FALSE, no naming support is done. Else if TRUE, names attributes of result are set.

Details

There are three different methods available for handling ties:

‘max’ for values with identical values the maximum rank is returned

‘average’ for values with identical values the average of the ranks they cover is returned. Note, that in this case the return value is of type ‘numeric’.

‘min’ for values with identical values the minimum rank is returned.

Value

a matrix of type integer is returned unless ties.method = “average”. It has dimensions’ N x J (K x J) matrix, where N (K) is the number of rows (columns) of the input x.

See Also

• matrixStats::rowRanks() and matrixStats::colRanks() which are used when the input is a matrix or numeric vector.

• base::rank

Examples

```r
mat <- matrix(rnorm(15), nrow = 5, ncol = 3)
mat[2, 1] <- NA
mat[3, 3] <- Inf
mat[4, 1] <- 0

print(mat)
rowRanks(mat)
colRanks(mat)
```
colSdDiffs.dgCMatrix-method

Calculates the standard deviation of the difference between each element of a row (column) of a matrix-like object

Description

Calculates the standard deviation of the difference between each element of a row (column) of a matrix-like object.

Usage

```r
## S4 method for signature 'dgCMatrix'
colSdDiffs(
  x,
  rows = NULL,
  cols = NULL,
  na.rm = FALSE,
  diff = 1L,
  trim = 0,
  useNames = TRUE
)
```

```r
## S4 method for signature 'dgCMatrix'
rowSdDiffs(
  x,
  rows = NULL,
  cols = NULL,
  na.rm = FALSE,
  diff = 1L,
  trim = 0,
  useNames = TRUE
)
```

Arguments

- `x` An NxK matrix-like object.
- `rows, cols` A vector indicating the subset of rows (and/or columns) to operate over. If `NULL`, no subsetting is done.
- `na.rm` If `TRUE`, missing values (NA or NaN) are omitted from the calculations.
- `diff` An integer specifying the order of difference.
- `trim` A double in [0,1/2] specifying the fraction of observations to be trimmed from each end of (sorted) x before estimation.
- `useNames` If `NA`, the default behavior of the function about naming support is remained. If `FALSE`, no naming support is done. Else if `TRUE`, names attributes of result are set.
colSds,xgCMatrix-method

**Details**

The S4 methods for \( x \) of type \texttt{matrix, array, table, or numeric} call \texttt{matrixStats::rowSdDiffs / matrixStats::colSdDiffs}.

**Value**

Returns a numeric vector of length \( N \) (\( K \)).

**See Also**

- \texttt{matrixStats::rowSdDiffs()} and \texttt{matrixStats::colSdDiffs()} which are used when the input is a matrix or numeric vector.
- for the direct standard deviation see \texttt{rowSds()}.

**Examples**

```r
mat <- matrix(rnorm(15), nrow = 5, ncol = 3)
mat[2, 1] <- NA
mat[3, 3] <- Inf
mat[4, 1] <- 0

print(mat)
rowSdDiffs(mat)
colSdDiffs(mat)
```

---

**Description**

Calculates the standard deviation for each row (column) of a matrix-like object.

**Usage**

```r
## S4 method for signature 'xgCMatrix'
colSds(
  x,
  rows = NULL,
  cols = NULL,
  na.rm = FALSE,
  center = NULL,
  useNames = TRUE
)
```
## S4 method for signature 'xgCMatrix'

```r
rowSds(
  x,
  rows = NULL,
  cols = NULL,
  na.rm = FALSE,
  center = NULL,
  useNames = TRUE
)
```

### Arguments

- **x**: An NxK matrix-like object.
- **rows, cols**: A vector indicating the subset of rows (and/or columns) to operate over. If `NULL`, no subsetting is done.
- **na.rm**: If `TRUE`, missing values (NA or NaN) are omitted from the calculations.
- **center**: (optional) the center, defaults to the row means.
- **useNames**: If `NA`, the default behavior of the function about naming support is remained. If `FALSE`, no naming support is done. Else if `TRUE`, names attributes of result are set.

### Details

The S4 methods for `x` of type `matrix`, `array`, `table`, or `numeric` call `matrixStats::rowSds` / `matrixStats::colSds`.

### Value

Returns a numeric vector of length N (K).

### See Also

- `matrixStats::rowSds()` and `matrixStats::colSds()` which are used when the input is a matrix or numeric vector.
- For mean estimates, see `rowMeans2()` and `rowMeans()`.
- For variance estimates, see `rowVars()`.

### Examples

```r
mat <- matrix(rnorm(15), nrow = 5, ncol = 3)
mat[2, 1] <- NA
mat[3, 3] <- Inf
mat[4, 1] <- 0

print(mat)

rowSds(mat)
colSds(mat)
```
colSums2,xgCMatrix-method

Calculates the sum for each row (column) of a matrix-like object

Description

Calculates the sum for each row (column) of a matrix-like object.

Usage

```r
## S4 method for signature 'xgCMatrix'
colSums2(x, rows = NULL, cols = NULL, na.rm = FALSE, useNames = TRUE)
```

## S4 method for signature 'xgCMatrix'
rowSums2(x, rows = NULL, cols = NULL, na.rm = FALSE, useNames = TRUE)

Arguments

- `x`: An NxK matrix-like object.
- `rows, cols`: A vector indicating the subset of rows (and/or columns) to operate over. If `NULL`, no subsetting is done.
- `na.rm`: If `TRUE`, missing values (`NA` or `NaN`) are omitted from the calculations.
- `useNames`: If `NA`, the default behavior of the function about naming support is remained. If `FALSE`, no naming support is done. Else if `TRUE`, names attributes of result are set.

Details

The S4 methods for `x` of type `matrix, array, table, or numeric` call `matrixStats::rowSums2` / `matrixStats::colSums2`.

Value

Returns a numeric vector of length N (K).

See Also

- `matrixStats::rowSums2()` and `matrixStats::colSums2()` which are used when the input is a matrix or numeric vector.
- For mean estimates, see `rowMeans2()` and `rowMeans()`.
- `base::sum()`.
Examples

```r
mat <- matrix(rnorm(15), nrow = 5, ncol = 3)
mat[2, 1] <- NA
mat[3, 3] <- Inf
mat[4, 1] <- 0

print(mat)
rowSums2(mat)
colSums2(mat)
```

Description

Tabulates the values in a matrix-like object by row (column).

Usage

```r
## S4 method for signature 'xgCMatrix'
colTabulates(x, rows = NULL, cols = NULL, values = NULL, useNames = TRUE)
## S4 method for signature 'xgCMatrix'
rowTabulates(x, rows = NULL, cols = NULL, values = NULL, useNames = TRUE)
```

Arguments

- `x`: An NxK matrix-like object.
- `rows, cols`: A vector indicating the subset of rows (and/or columns) to operate over. If `NULL`, no subsetting is done.
- `values`: the values to search for.
- `useNames`: If `NA`, the default behavior of the function about naming support is remained. If `FALSE`, no naming support is done. Else if `TRUE`, names attributes of result are set.

Details

The S4 methods for `x` of type `matrix, array, table, or numeric` call `matrixStats::rowTabulates` / `matrixStats::colTabulates`.

Value

A numeric NxJ (KxJ) matrix, where N (K) is the number of rows (columns) for which the J values are calculated.
See Also

- matrixStats::rowTabulates() and matrixStats::colTabulates() which are used when the input is a matrix or numeric vector.
- base::table()

Examples

```r
mat <- matrix(rpois(15, lambda = 3), nrow = 5, ncol = 3)
mat[2, 1] <- NA_integer_
mat[3, 3] <- 0L
mat[4, 1] <- 0L

print(mat)
rowTabulates(mat)
colTabulates(mat)

rowTabulates(mat, values = 0)
colTabulates(mat, values = 0)
```

---

**colVarDiffs, dgCMatric-method**

*Calculates the variance of the difference between each element of a row (column) of a matrix-like object*

Description

Calculates the variance of the difference between each element of a row (column) of a matrix-like object.

Usage

```r
## S4 method for signature 'dgCMatric'
colVarDiffs(
x,
rows = NULL,
cols = NULL,
na.rm = FALSE,
diff = 1L,
trim = 0,
useNames = TRUE
)
```

```r
## S4 method for signature 'dgCMatric'
rowVarDiffs(
x,
rows = NULL,
```
Arguments

x An NxK matrix-like object.
rows, cols A vector indicating the subset of rows (and/or columns) to operate over. If NULL, no subsetting is done.
na.rm If TRUE, missing values (NA or NaN) are omitted from the calculations.
diff An integer specifying the order of difference.
trim A double in [0,1/2] specifying the fraction of observations to be trimmed from each end of (sorted) x before estimation.
useNames If NA, the default behavior of the function about naming support is remained. If FALSE, no naming support is done. Else if TRUE, names attributes of result are set.

Details

The S4 methods for x of type matrix, array, table, or numeric call matrixStats::rowVarDiffs / matrixStats::colVarDiffs.

Value

Returns a numeric vector of length N (K).

See Also

• matrixStats::rowVarDiffs() and matrixStats::colVarDiffs() which are used when the input is a matrix or numeric vector.
• for the direct variance see rowVars().

Examples

mat <- matrix(rnorm(15), nrow = 5, ncol = 3)
mat[2, 1] <- NA
mat[3, 3] <- Inf
mat[4, 1] <- 0

print(mat)
rowVarDiffs(mat)
colVarDiffs(mat)
colVars,xgCMatrix-method

*Calculates the variance for each row (column) of a matrix-like object*

Description

Calculates the variance for each row (column) of a matrix-like object.

Usage

```r
## S4 method for signature 'xgCMatrix'
colVars(
  x,
  rows = NULL,
  cols = NULL,
  na.rm = FALSE,
  center = NULL,
  useNames = TRUE
)

## S4 method for signature 'xgCMatrix'
rowVars(
  x,
  rows = NULL,
  cols = NULL,
  na.rm = FALSE,
  center = NULL,
  useNames = TRUE
)
```

Arguments

- `x` An NxK matrix-like object.
- `rows, cols` A `vector` indicating the subset of rows (and/or columns) to operate over. If `NULL`, no subsetting is done.
- `na.rm` If `TRUE`, missing values (NA or NaN) are omitted from the calculations.
- `center` (optional) the center, defaults to the row means.
- `useNames` If `NA`, the default behavior of the function about naming support is remained. If `FALSE`, no naming support is done. Else if `TRUE`, names attributes of result are set.

Details

The S4 methods for `x` of type `matrix`, `array`, `table`, or `numeric` call `matrixStats::rowVars` / `matrixStats::colVars`.
Value

Returns a numeric vector of length N (K).

See Also

• matrixStats::rowVars() and matrixStats::colVars() which are used when the input is a matrix or numeric vector.
• For mean estimates, see rowMeans2() and rowMeans().
• For standard deviation estimates, see rowSds().
• stats::var().

Examples

```r
mat <- matrix(rnorm(15), nrow = 5, ncol = 3)
mat[2, 1] <- NA
mat[3, 3] <- Inf
mat[4, 1] <- 0

print(mat)
rowVars(mat)
colVars(mat)
```

colWeightedMads, dgCMATRIX-method

Calculates the weighted median absolute deviation for each row (column) of a matrix-like object

Description

Calculates the weighted median absolute deviation for each row (column) of a matrix-like object.

Usage

```r
## S4 method for signature 'dgCMATRIX'
colWeightedMads(
  x,
  w = NULL,
  rows = NULL,
  cols = NULL,
  na.rm = FALSE,
  constant = 1.4826,
  center = NULL,
  useNames = TRUE
)
```

```r
## S4 method for signature 'dgCMATRIX'
```
rowWeightedMads(  
  x,
  w = NULL,
  rows = NULL,
  cols = NULL,
  na.rm = FALSE,
  constant = 1.4826,
  center = NULL,
  useNames = TRUE
)

Arguments

x  An NxK matrix-like object.
w  A numeric vector of length K (N) that specifies by how much each element is weighted.
rows, cols  A vector indicating the subset of rows (and/or columns) to operate over. If NULL, no subsetting is done.
na.rm  If TRUE, missing values (NA or NaN) are omitted from the calculations.
constant  A scale factor. See stats::mad() for details.
center  Not supported at the moment.
useNames  If NA, the default behavior of the function about naming support is remained. If FALSE, no naming support is done. Else if TRUE, names attributes of result are set.

Details

The S4 methods for x of type matrix, array, table, or numeric call matrixStats::rowWeightedMads / matrixStats::colWeightedMads.

Value

Returns a numeric vector of length N (K).

See Also

• matrixStats::rowWeightedMads() and matrixStats::colWeightedMads() which are used when the input is a matrix or numeric vector.

• See also rowMads for the corresponding unweighted function.

Examples

mat <- matrix(0, nrow=10, ncol=5)
mat[sample(prod(dim(mat)), 25)] <- rpois(n=25, 5)
sp_mat <- as(mat, "dgCMatrix")
weights <- rnorm(10, mean=1, sd=0.1)

# sparse version
colWeightedMeans(xgCMatrix-method)

Calculates the weighted mean for each row (column) of a matrix-like object.

Description

Calculates the weighted mean for each row (column) of a matrix-like object.

Usage

## S4 method for signature 'xgCMatrix'
colWeightedMeans(
  x,
  w = NULL,
  rows = NULL,
  cols = NULL,
  na.rm = FALSE,
  useNames = TRUE
)

## S4 method for signature 'xgCMatrix'
rowWeightedMeans(
  x,
  w = NULL,
  rows = NULL,
  cols = NULL,
  na.rm = FALSE,
  useNames = TRUE
)

Arguments

x
An NxK matrix-like object.

w
A numeric vector of length K (N) that specifies by how much each element is weighted.

rows, cols
A vector indicating the subset of rows (and/or columns) to operate over. If NULL, no subsetting is done.

na.rm
If TRUE, missing values (NA or NaN) are omitted from the calculations.
useNames

If NA, the default behavior of the function about naming support is remained. If FALSE, no naming support is done. Else if TRUE, names attributes of result are set.

Details

The S4 methods for x of type matrix, array, table, or numeric call matrixStats::rowWeightedMeans / matrixStats::colWeightedMeans.

Value

Returns a numeric vector of length N (K).

See Also

- matrixStats::rowWeightedMeans() and matrixStats::colWeightedMeans() which are used when the input is a matrix or numeric vector.
  - See also rowMeans2 for the corresponding unweighted function.

Examples

```r
mat <- matrix(rnorm(15), nrow = 5, ncol = 3)
mat[2, 1] <- NA
mat[3, 3] <- Inf
mat[4, 1] <- 0

print(mat)
w <- rnorm(n = 5, mean = 3)
rowWeightedMeans(mat, w = w[1:3])
colWeightedMeans(mat, w = w)
```

---

colWeightedMedians.dgCMatrix-method

Calculates the weighted median for each row (column) of a matrix-like object

Description

Calculates the weighted median for each row (column) of a matrix-like object.

Usage

```r
## S4 method for signature 'dgCMatrix'
colWeightedMedians(
  x,
  w = NULL,
  rows = NULL,
  cols = NULL,
)"
Arguments

x      An NxK matrix-like object.
w      A numeric vector of length K (N) that specifies by how much each element is weighted.
rows, cols   A vector indicating the subset of rows (and/or columns) to operate over. If NULL, no subsetting is done.
na.rm      If TRUE, missing values (NA or NaN) are omitted from the calculations.
useNames    If NA, the default behavior of the function about naming support is remained. If FALSE, no naming support is done. Else if TRUE, names attributes of result are set.

Details

The S4 methods for x of type matrix, array, table, or numeric call matrixStats::rowWeightedMedians / matrixStats::colWeightedMedians.

Value

Returns a numeric vector of length N (K).

See Also

- matrixStats::rowWeightedMedians() and matrixStats::colWeightedMedians() which are used when the input is a matrix or numeric vector.
- See also rowMedians for the corresponding unweighted function.

Examples

mat <- matrix(rnorm(15), nrow = 5, ncol = 3)
mat[2, 1] <- NA
mat[3, 3] <- Inf
mat[4, 1] <- 0

print(mat)
w <- rnorm(n = 5, mean = 3)
rowWeightedMedians(mat, w = w[1:3])
colWeightedMedians(mat, w = w)

---

**Description**

Calculates the weighted standard deviation for each row (column) of a matrix-like object.

**Usage**

```r
## S4 method for signature 'xgCMatrix'
colWeightedSds(
  x,
  w = NULL,
  rows = NULL,
  cols = NULL,
  na.rm = FALSE,
  useNames = TRUE
)
## S4 method for signature 'xgCMatrix'
rowWeightedSds(
  x,
  w = NULL,
  rows = NULL,
  cols = NULL,
  na.rm = FALSE,
  useNames = TRUE
)
```

**Arguments**

- **x**: An NxK matrix-like object.
- **w**: A numeric vector of length K (N) that specifies by how much each element is weighted.
- **rows, cols**: A vector indicating the subset of rows (and/or columns) to operate over. If NULL, no subsetting is done.
- **na.rm**: If TRUE, missing values (NA or NaN) are omitted from the calculations.
- **useNames**: If NA, the default behavior of the function about naming support is remained. If FALSE, no naming support is done. Else if TRUE, names attributes of result are set.
Details

The S4 methods for \( x \) of type \texttt{matrix}, \texttt{array}, \texttt{table}, or \texttt{numeric} call \texttt{matrixStats::rowWeightedSds} / \texttt{matrixStats::colWeightedSds}.

Value

Returns a \texttt{numeric vector} of length \( N \) (\( K \)).

See Also

- \texttt{matrixStats::rowWeightedSds()} and \texttt{matrixStats::colWeightedSds()} which are used when the input is a \texttt{matrix} or \texttt{numeric} vector.
- See also \texttt{rowSds} for the corresponding unweighted function.

Examples

```r
mat <- matrix(rnorm(15), nrow = 5, ncol = 3)
mat[2, 1] <- NA
mat[3, 3] <- Inf
mat[4, 1] <- 0

print(mat)
w <- rnorm(n = 5, mean = 3)
rowWeightedSds(mat, w = w[1:3])
colWeightedSds(mat, w = w)
```

Description

Calculates the weighted variance for each row (column) of a matrix-like object.

Usage

```r
## S4 method for signature 'xgCMatrix'
colWeightedVars(x,
    w = NULL,
    rows = NULL,
    cols = NULL,
    na.rm = FALSE,
    useNames = TRUE
)
```
## S4 method for signature 'xgCMatrix'
rowWeightedVars(
  x,
  w = NULL,
  rows = NULL,
  cols = NULL,
  na.rm = FALSE,
  useNames = TRUE
)

### Arguments

- **x**: An N×K matrix-like object.
- **w**: A numeric vector of length K (N) that specifies by how much each element is weighted.
- **rows, cols**: A vector indicating the subset of rows (and/or columns) to operate over. If NULL, no subsetting is done.
- **na.rm**: If TRUE, missing values (NA or NaN) are omitted from the calculations.
- **useNames**: If NA, the default behavior of the function about naming support is remained. If FALSE, no naming support is done. Else if TRUE, names attributes of result are set.

### Details

The S4 methods for x of type matrix, array, table, or numeric call matrixStats::rowWeightedVars / matrixStats::colWeightedVars.

### Value

Returns a numeric vector of length N (K).

### See Also

- matrixStats::rowWeightedVars() and matrixStats::colWeightedVars() which are used when the input is a matrix or numeric vector.
- See also rowVars for the corresponding unweighted function.

### Examples

```r
mat <- matrix(rnorm(15), nrow = 5, ncol = 3)
mat[2, 1] <- NA
mat[3, 3] <- Inf
mat[4, 1] <- 0

print(mat)
w <- rnorm(n = 5, mean = 3)
rowWeightedVars(mat, w = w[1:3])
colWeightedVars(mat, w = w)
```
