Package ‘topdownr’

May 30, 2024

Title   Investigation of Fragmentation Conditions in Top-Down Proteomics

Version 1.26.0

Description The topdownr package allows automatic and systemic investigation of fragment conditions. It creates Thermo Orbitrap Fusion Lumos method files to test hundreds of fragmentation conditions. Additionally it provides functions to analyse and process the generated MS data and determine the best conditions to maximise overall fragment coverage.

Depends R (>= 3.5), methods, BiocGenerics (>= 0.20.0), ProtGenerics (>= 1.10.0), Biostrings (>= 2.42.1), S4Vectors (>= 0.12.2)

Imports grDevices, stats, tools, utils, Biobase, Matrix (>= 1.4-2), MSnbase (>= 2.3.10), PSMatch (>= 1.6.0), ggplot2 (>= 2.2.1), mzR (>= 2.27.5)

Suggests topdownrdata (>= 0.2), knitr, rmarkdown, ranger, testthat, BiocStyle, xml2

License GPL (>= 3)

Repository Bioconductor 3.19
Description

The topdownr package allows automatic and systemic investigation of fragment conditions. It creates Thermo Orbitrap Fusion Lumos method files to test hundreds of fragmentation conditions. Additionally it provides functions to analyse and process the generated MS data and determine the best conditions to maximise overall fragment coverage.

Details

The usage of the topdownr package is demonstrated in the following vignettes:

- Generate .meth files prior data acquisition for the Thermo Orbitrap Fusion Lumos MS devise: vignette("data-generation", package="topdownr").
- How to analyse top-down fragmentation data: vignette("analysis", package="topdownr")

AbstractTopDownSet-class

The AbstractTopDownSet class

Description

Abstract/VIRTUAL parent class for TopDownSet and NCBSet to provide common interface.

Usage

```r
## S4 method for signature 'AbstractTopDownSet,ANY,ANY,ANY'
x[i, j, ..., drop = FALSE]

## S4 method for signature 'AbstractTopDownSet,ANY,missing'
x[[i, j, ...]]

## S4 replacement method for signature 'AbstractTopDownSet,ANY,missing'
x[[i, j, ...]] <- value

## S4 method for signature 'AbstractTopDownSet'
x$name

## S4 replacement method for signature 'AbstractTopDownSet'
x$name <- value

## S4 method for signature 'AbstractTopDownSet'
assayData(object)

## S4 method for signature 'AbstractTopDownSet'
colData(object)

## S4 replacement method for signature 'AbstractTopDownSet'
colData(object, ...) <- value

## S4 method for signature 'AbstractTopDownSet,AbstractTopDownSet'
combine(x, y)
```
## AbstractTopDownSet-class

### S4 method for signature 'AbstractTopDownSet'

```r
conditionData(object, ...)```

### S4 replacement method for signature 'AbstractTopDownSet'

```r
conditionData(object, ...) <- value```

### S4 method for signature 'AbstractTopDownSet'

```r
conditionNames(object)```

### S4 method for signature 'AbstractTopDownSet'

```r
dim(x)```

### S4 method for signature 'AbstractTopDownSet'

```r
dimnames(x)```

### S4 method for signature 'AbstractTopDownSet'

```r
removeEmptyConditions(object)```

### S4 method for signature 'AbstractTopDownSet'

```r
rowViews(object, ...)```

### S4 method for signature 'AbstractTopDownSet'

```r
show(object)```

### S4 method for signature 'AbstractTopDownSet'

```r
summary(object, what = c("rows", "columns"), ...)```

### S4 method for signature 'AbstractTopDownSet'

```r
updateConditionNames(
  object,
  sampleColumns = c("Mz", "AgcTarget", "EtdReagentTarget", "EtdActivation",
    "CidActivation", "HcdActivation", "UvpdActivation"),
  verbose = interactive()
)
```

### S4 method for signature 'AbstractTopDownSet'

```r
updateMedianInjectionTime(
  object,
  by = list(Mz = object$Mz, AgcTarget = object$AgcTarget)
)
```

### Arguments

- `i,j` numeric, logical or character, indices specifying elements to extract or replace.
- `drop` logical, currently ignored.
- `value` replacement value.
- `name` character name of an (non)existing column in colData.
AbstractTopDownSet-class

object, x  AbstractTopDownSet
y          AbstractTopDownSet
what       character, specifies whether "rows" or "columns" should be summarized.
sampleColumns character, column names of the colData() used to define a sample (technical replicate). This is used to add the Sample column (used for easier aggregation, etc.).
verbose    logical, verbose output?
by         list, grouping information.
...        arguments passed to internal/other methods.

Details

This class just provides a common interface. It is not intended for direct use by the user. Please see TopDownSet for an example usage of its child class.

Value

This is an Abstract/VIRTUAL class to provide a common interface for TopDownSet and NCBSet. It is not possible to create an AbstractTopDownSet object.

Methods (by generic)

- • x[i]: Subset operator.
  For i numeric, logical or character vectors or empty (missing) or NULL are supported. Subsetting is done on the fragment/bond (row) level. character indices could be names (e.g. c("a1", "b1", "c1", "c2", "c3")) or types (e.g. c("c", "x")) of the fragments for TopDownSet objects, or names of the bonds (e.g. c("bond001")) for NCBSet objects.
  j could be a numeric or logical vector and subsetting is done on the condition/run (column) level.

- • x[[i]: Subset operator.
  i could be a numeric or logical vector and subsetting is done on the condition/run (column) level.

- • '[[_(x = AbstractTopDownSet, i = ANY, j = missing) <- value: Setter for a column in the colData slot.
  The [[<- operator is used to add/replace a single column of the colData DataFrame.

- • '$: Accessor for columns in the colData slot.
  The $ simplifies the accession of a single column of the colData. It is identical to the [[ operator.

- • '$(AbstractTopDownSet) <- value: Setter for a column in the colData slot.
  The $<- operator is used to add/replace a single column of the colData DataFrame. It is identical to the [[<- operator.

- • assayData(AbstractTopDownSet): Accessor for the assay slot.
  Returns a Matrix::dgCMatrix that stores the intensity/coverage information of AbstractTopDownSet object.
• **colData(AbstractTopDownSet):** Accessor for the colData slot.
  Returns a **S4Vectors::DataFrame** that stores metadata for the conditions/runs (columns) of the AbstractTopDownSet object.

• **colData(AbstractTopDownSet) <- value:** Setter for the colData slot.
  Replaces metadata for the conditions/runs (columns) of the AbstractTopDownSet object.

• **combine(x = AbstractTopDownSet, y = AbstractTopDownSet):** Combine AbstractTopDownSet objects.
  `combine` allows to combine two or more AbstractTopDownSet objects. Please note that it uses the default sampleColumns to define technical replicates (see `readTopDownFiles()`). The default by argument to group ion injection times for the calculation of the median time (see `updateMedianInjectionTime()`). Both could be modified after combine by calling `updateConditionNames()` (with modified sampleColumns argument) and `updateMedianInjectionTime()` (with modified by argument).

• **conditionData(AbstractTopDownSet):** Accessor for the colData slot.
  An alias for colData.

• **conditionData(AbstractTopDownSet) <- value:** Setter for the colData slot.
  An alias for colData<-.  

• **conditionNames(AbstractTopDownSet):** Accessor for condition names.
  Returns a character with names for the conditions/runs (columns).

• **dim(AbstractTopDownSet):** Accessor for dimensions.
  Returns a numeric with number of fragments/bonds (rows) and conditions/runs (columns).

• **dimnames(AbstractTopDownSet):** Accessor for dimension names.
  Returns a list with names for the fragments/bonds (rows) and for the conditions/runs (columns).

• **removeEmptyConditions(AbstractTopDownSet):** Remove empty conditions/runs.
  Removes conditions/runs (columns) without any intensity/coverage information from the AbstractTopDownSet object. It returns a modified AbstractTopDownSet object.

• **rowViews(AbstractTopDownSet):** Accessor for the rowViews slot.
  Depending on the implementation it returns an FragmentViews object for TopDownSet objects or an Biostrings::XStringViews object for NCBSet objects.

• **summary(AbstractTopDownSet):** Summary statistics.
  Returns a matrix with some statistics: number of fragments, total/min/first quartile/median/mean/third quartile/maximum of intensity values.

• **updateConditionNames(AbstractTopDownSet):** Update condition names.
  Updates condition names based on sampleColumns from conditionData/colData. Columns with just identical entries are ignored. This method will create/update the colData(object)$Sample column that identifies technical replicates and could be used in other methods.

• **updateMedianInjectionTime(AbstractTopDownSet):** Update median ion injection times.
  Recalculates median ion injection times by a user given grouping variable (default: Mz, AgcTarget). This is useful if you acquire new data and the ion injection time differs across the runs. Use the by argument to provide a list/data.frame of grouping variables, e.g. by=colData(object)[, c("Mz", "AgcTarget", "File")].
Slots

rowViews  Biostrings::XStringViews, information about fragments/bonds (name, type, sequence, mass, charge), see Biostrings::XStringViews and FragmentViews for details.

colData  S4Vectors::DataFrame, information about the MS2 experiments and the fragmentation conditions.

assay  Matrix::dgCMatrix, intensity/coverage values of the fragments/bonds. The rows correspond to the fragments/bonds and the columns to the condition/run. It just stores values that are different from zero.

files  character, files that were imported.

processing  character, log messages.

Author(s)

Sebastian Gibb <mail@sebastiangibb.de>

```
createExperimentsFragmentOptimisation

Create fragment optimisation experiment

Description
This function is used to create a tree-like list of all combinations of a user-given set of MS1 and TMS2 settings for an fragment optimisation experiment. The list could be written to an Orbitrap Fusion Lumos method xml file using writeMethodXm2s().

Usage
createExperimentsFragmentOptimisation(
  ms1,  
  ...,  
  groupBy = c("AqcTarget", "replication"),  
  nMs2perMs1 = 10,  
  scanDuration = 0,  
  replications = 2,  
  randomise = TRUE  
)

Arguments
ms1 data.frame, MS1 settings.
... further named arguments with data.frames containing the TMS2 settings.
groupBy character, group experiments by columns in the TMS2 data.frames. The columns have to be present in all data.frames. Each group will be written to its own XML file.
nMs2perMs1 integer, how many TMS2 scans should be run after a MS1 scan?
scanDuration double, if greater than zero (e.g. scanDuration=0.5) the Start/EndTimeMin are overwritten with a duration of scanDuration. If scanDuration is zero (default) Start/EndTimeMin are not overwritten.
replications integer, number of replications.
randomise logical, should the TMS2 scan settings randomised?
createExperimentsFragmentOptimisation

Value
list, able to be written via {xml2::as_xml_document}()

)

exps <- createExperimentsFragmentOptimisation(
  ms1=ms1, cid560, cid700,
  groupBy=c("AgcTarget", "replication"), nMs2perMs1=10, scanDuration=0.5,
  replications=2, randomise=TRUE
)

## use a CSV (or excel) file as input

myCsvContent <- "
ActivationType, ETDReactionTime, UVPDActivationTime
UVPD,,1000
ETD,1000,
"

myCsvSettings <- read.csv(text=myCsvContent, stringsAsFactors=FALSE)

# ActivationType ETDReactionTime UVPDActivationTime
# 1  UVPD NA 1000
# 2  ETD 1000 NA

exps <- createExperimentsFragmentOptimisation(
  ms1 = data.frame(FirstMass=500, LastMass=1000),
  ## TMS2
  myCsvSettings,
  ## other arguments
  groupBy="ActivationType"
)
createTngFusionMethFiles

Windows specific functions.

Description

The functions runXmlMethodChanger and runScanHeadsman call XmlMethodChanger.exe and ScanHeadsman.exe with the corresponding arguments. The only work on Windows (maybe on Linux + wine as well but that was never tested).

Usage

createTngFusionMethFiles(
  template,
  xml = list.files(pattern = ".*\.xml$"),
  executable = "XmlMethodChanger.exe",
  verbose = interactive()
)

runXmlMethodChanger(
  template,
  xml = list.files(pattern = ".*\.xml$"),
  executable = "XmlMethodChanger.exe",
  verbose = interactive()
)

runScanHeadsman(path = ".", executable = "ScanHeadsman.exe")

Arguments

  template character, path to template .meth file.
  xml character, vector of path to .xml files.
  executable character, path to the XmlMethodChanger.exe or ScanHeadsman.exe executable.
  verbose logical, if TRUE a progress bar is shown.
  path character, path to the directory containing the .raw files.

Details

runXmlMethodChanger applies ‘XmlMethodChanger.exe’ on all given XML files generated with writeMethodXmls() to create .meth files from a template.

runScanHeadsman calls ScanHeadsman.exe on a given directory containing .raw files. ScanHeadsman.exe extracts the method and scan header data into .experiments.csv and .txt files, respectively.

Value

Nothing. Used for its side effects.

                      modificationXml=list.files(pattern="^method.*\.xml$"),
                      executable="..\XmlMethodChanger.exe")

## End(Not run)
## Not run:
runScanHeadsman("raw", executable="..\ScanHeadsman.exe")

## End(Not run)

expandMs1Conditions  Expand MS Conditions

Description

Create a data.frame of all possible combinations of the given arguments. It ensures that just
arguments are applied that yield a valid MethodModification.xml file.

Usage

expandMs1Conditions(..., family = "Calcium", version = "3.2")

expandTms2Conditions(
  ActivationType = c("CID", "HCD", "ETD", "UVPD"),
  ...
  MassList = NULL,
  family = "Calcium",
  version = "3.2"
)

Arguments

... further named arguments, used to create the combination of conditions.
family character, currently just Calcium is supported
version character, currently 3.1, 3.2 (default), 3.3 are supported
ActivationType character, ActivationType for TMS2, either CID, HCD, ETD, or UVPD.
MassList matrix, 2 columns (mass, z) for targeted mass list, or NULL (default) to not overwrite targeted mass.

Value
data.frame with all possible combinations of conditions/settings.

See Also
validMs1Settings()
validTms2Settings(), expand.grid()

Examples
expandMs1Conditions(FirstMass=100, LastMass=400)
expandTms2Conditions(
  ActivationType="CID",
  OrbitrapResolution="R120K",
  IsolationWindow=1,
  MaxITTimeInMS=200,
  Microscans=as.integer(40),
  AgcTarget=c(1e5, 5e5, 1e6),
  CIDCollisionEnergy=c(NA, seq(7, 35, 7)),
  MassList=cbind(mz=c(560.6, 700.5, 933.7), z=rep(1, 3))
)

FragmentViews-class

The FragmentViews class

Description
The FragmentViews class is a basic container for storing a set of views (start/end locations) on the same peptides/protein sequence. Additionally it keeps information about mass, type and charge of the fragments.

Usage
FragmentViews(
  sequence, mass, type, z = 1L, start = NULL, end = NULL, width = NULL, names = NULL, metadata = list()
)
FragmentViews-class

## S4 method for signature 'FragmentViews,FragmentViews'
combine(x, y)

## S4 method for signature 'FragmentViews'
mz(object, ...)

## S4 method for signature 'FragmentViews'
show(object)

### Arguments

- `sequence` character/`Biostrings::AAString`, complete protein/peptide sequence.
- `mass` double, mass of the fragments, same length as `start/end/width`.
- `type` character, type of the fragments, same length as `start/end/width`.
- `z` integer, charge of the fragments, length one or same length as `start/end/width`.
- `start` integer, start positions of the fragments. At least two of `start/end/width` has to be given.
- `end` integer, end positions of the fragments. At least two of `start/end/width` has to be given.
- `width` integer, width positions of the fragments. At least two of `start/end/width` has to be given.
- `names` character, names of the fragments, same length as `start/end/width`.
- `metadata` list, metadata like modifications.
- `object, x, y` FragmentViews
- `...` arguments passed to internal/other methods.

### Details

FragmentViews extends `Biostrings::XStringViews`. In short it combines an `IRanges::IRanges` object to store start/end location on a sequence, an `Biostrings::AAString` object.

### Value

An `FragmentViews` object.

### Functions

- `FragmentViews()`: Constructor
  In general it is not necessary to call the constructor manually. See `readTopDownFiles()` instead.

### Coercion

`as(object, "data.frame")`: Coerce an `FragmentViews` object into a `data.frame`. 
NCBSet-class

    mass=c(72.04439, 232.07504, 361.11763),
    type="b", z=1)
fv

# Coercion to data.frame
as(fv, "data.frame")
as(fv, "data.frame")

NCBSet-class

The NCBSet class

Description
The NCBSet class is a container for a top-down proteomics experiment similar to the TopDownSet
but instead of intensity values it just stores the information if a bond is covered by a N-terminal
(encoded as 1), a C-terminal (encoded as 2) and/or bidirectional fragments (encoded as 3).

Usage

## S4 method for signature 'NCBSet'
bestConditions(
    object,
    n = ncol(object),
    minN = 0L,
    maximise = c("fragments", "bonds"),
    ...
)

## S4 method for signature 'NCBSet'
fragmentationMap(
    object,
    nCombinations = 10,
    cumCoverage = TRUE,
    maximise = c("fragments", "bonds"),
    labels = colnames(object),
    alphaIntensity = TRUE,
    ...
## S4 method for signature 'NCBSet' 
show(object)

## S4 method for signature 'NCBSet'
summary(object, what = c("conditions", "bonds"), ...)

### Arguments

- **object**: NCBSet
- **n**: integer, max number of combinations/iterations.
- **minN**: integer, stop if there are less than minN additional fragments
- **maximise**: character, optimisation targeting for the highest number of "fragments" (default) or "bonds".
- **nCombinations**: integer, number of combinations to show (0 to avoid plotting them at all).
- **cumCoverage**: logical, if TRUE (default) cumulative coverage of combinations is shown.
- **labels**: character, overwrite x-axis labels.
- **alphaIntensity**: logical, if TRUE (default) the alpha level of the color is used to show the $colData(object)$AssignedIntensity. If FALSE the alpha is set to 1.
- **what**: character, specifies whether "conditions" (columns; default) or "bonds" (rows) should be summarized.
- **...**: arguments passed to internal/other methods. added.

### Value

An NCBSet object.

### Methods (by generic)

- **bestConditions(NCBSet)**: Best combination of conditions.
  Finds the best combination of conditions for highest coverage of fragments or bonds. If there are two (or more conditions) that would add the same number of fragments/bonds the one with the highest assigned intensity is used. Use n to limit the number of iterations and combinations that should be returned. If minN is set at least minN fragments have to be added to the combinations. The function returns a 7-column matrix. The first column contains the index (Index) of the condition (column number). The next columns contain the newly added number of fragments or bonds (FragmentsAddedToCombination, BondsAddedToCombination), the fragments or bonds in the condition (FragmentsInCondition, BondsInCondition), and the cumulative coverage fragments or bonds (FragmentCoverage, BondCoverage).

- **fragmentationMap(NCBSet)**: Plot fragmentation map.
  Plots a fragmentation map of the Protein. Use nCombinations to add another plot with nCombinations combined conditions. If cumCoverage is TRUE (default) these combinations increase the coverage cumulatively.

- **summary(NCBSet)**: Summary statistics.
  Returns a matrix with some statistics: number of fragments, total/min/first quartile/median/mean/third quartile/maximum of intensity values.
Slots

rowViews  Biostrings::XStringViews, information about bonds (name, start, end, width, sequence), see Biostrings::XStringViews for details.

colData  S4Vectors::DataFrame, information about the MS2 experiments and the fragmentation conditions.

assay  Matrix::dgCMatrix, coverage values of the bonds. The rows correspond to the bonds and the columns to the condition/run. It just stores values that are different from zero. If a bond is covered by an N-terminal fragment its encoded with 1, by an C-terminal fragmentl with 2 and by both fragment types/bidirectional by 3 respectively.

files  character, files that were imported.

processing  character, log messages.

# Condition 1 to 10
ncb[, 1:10]

# Plot fragmentation map
fragmentationMap(ncb)

---

readTopDownFiles

**Read top-down files.**

---

**Description**

It creates a TopDownSet object and is its only constructor.

**Usage**

```r
readTopDownFiles(
  path,
  pattern = ".*",
  type = c("a", "b", "c", "x", "y", "z"),
  modifications = c("Carbamidomethyl", "Acetyl", "Met-loss"),
  customModifications = data.frame(),
  adducts = data.frame(),
  neutralLoss = PSMatch::defaultNeutralLoss(),
  sequenceOrder = c("original", "random", "inverse"),
  tolerance = 5e-06,
  redundantIonMatch = c("remove", "closest"),
  redundantFragmentMatch = c("remove", "closest"),
  dropNonInformativeColumns = TRUE,
  conditions = "ScanDescription",
  verbose = interactive()
)
```

**Arguments**

- **path** character, path to directory that contains the top-down files.
- **pattern** character, a filename pattern, the default .* means all files.
- **type** character, type of fragments, currently a-c and x-z are supported, see `PSMatch::calculateFragments()` for details.
- **modifications** character, unimod names of modifications that should be applied. Currently just Acetyl (Unimod:1 but just protein N-term), Carbamidomethyl (Unimod:4) and Met-loss (Unimod:765) are supported. Met-loss removes M (if followed by
A, C, G, P, S, T, or V; (see also http://www.unimod.org/modifications_view.php?editid1=1,
for details)). Use NULL to disable all modifications.

customModifications
data.frame, with 4 columns, namely: mass, name, location, variable, see de-
tails section.

adducts
data.frame, with 3 columns, namely: mass, name, to, see details section.

neutralLoss
list, neutral loss that should be applied, see PSMatch::calculateFragments() and
PSMatch::defaultNeutralLoss() for details.

sequenceOrder character, order of the sequence before fragment calculation and matching is
done. "original" doesn't change anything. "inverse" reverse the sequence and "random" arranges the amino acid sequence at random.

tolerance double, tolerance in ppm that is used to match the theoretical fragments with
the observed ones.

redundantIonMatch
character, a mz could be matched to one, two or more fragments. If it is
matched against more than one fragment the match could be "remove"d or the
match to the "closest" fragment could be chosen.

redundantFragmentMatch
character, one or more mz could be matched to the same fragment, these
matches could be "remove"d or the match to the "closest" mz is chosen.

dropNonInformativeColumns
logical, should columns with just one identical value across all runs be removed?

sampleColumns character, column names of the colData() used to define a sample (technical
replicate). This is used to add the Sample column (used for easier aggregation,
etc.).

conditions character/numeric, one of:
• "ScanDescription" (default): create condition IDs based on the given
  "Scan Description" parameter (set automatically by createExperimentsFragmentOptimisation())
• "FilterString": create condition IDs based on mass labels in the Filter-
  String column (included for backward-compatibilty, used in writeMethodXmIs() prior
  version 1.5.2 in Dec 2018).
  • A single numeric value giving the number of conditions.

verbose logical, verbose output?

Details

readTopDownFiles reads and processes all top-down files, namely:
• .fasta (protein sequence)
• .mzML (spectra)
• .experiments.csv (method/fragmentation conditions)
• .txt (scan header information)
customModifications: additional to the provided unimod modifications available through the modifications argument customModifications allow to apply user-defined modifications to the output of `PSMatch::calculateFragments()`. The customModifications argument takes a data.frame with the mass to add, the name of the modification, the location (could be the position of the amino acid or "N-term"/"C-term"), whether the modification is always seen (variable=FALSE) or both, the modified and unmodified amino acid are present (variable=TRUE), e.g. for Activation (which is available via modification="Acetyl") data.frame(mass=42.010565, name="Acetyl", location="N-term", variable=FALSE) or variable one (that could be present or not): data.frame(mass=365.132, name="Custom", location=10, variable=TRUE)

If the customModifications data.frame contains multiple columns the modifications are applied from row one to the last row one each time.

adducts: Thermo's Xtract allows some mistakes in deisotoping, mostly it allows +/- C13-C12 and +/- H+. The adducts argument takes a data.frame with the mass to add, the name that should assign to these new fragments and an information to whom the modification should be applied, e.g. for H+ on z. data.frame(mass=1.008, name="zpH", to="z").

Please note: The adducts are added to the output of `PSMatch::calculateFragments()` That has some limitations, e.g. neutral loss calculation could not be done in topdownr-package. If neutral loss should be applied on adducts you have to create additional rows, e.g.: data.frame(mass=c(1.008, 1.008), name=c("cpH", "cpH_"), to=c("c", "c_"))

Value

A TopDownSet object.

See Also

`PSMatch::calculateFragments()`, `PSMatch::defaultNeutralLoss()`

Examples

```r
if (require("topdownrdata")) {
  # add H+ to z and no neutral loss of water
  tds <- readTopDownFiles(
    toptopdownrdata::topDownDataPath("myoglobin"),
    ## Use an artificial pattern to load just the fasta
    ## file and files from m/z == 1211, ETD reagent
    ## target 1e6 and first replicate to keep runtime
    ## of the example short
    pattern=".*fasta.gz|1211_.1|1e6_1",
    adducts=data.frame(mass=1.008, name="zpH", to="z"),
    neutralLoss=PSMatch::defaultNeutralLoss(
      disableWaterLoss=c("Cterm", "D", "E", "S", "T")),
    tolerance=25e-6
  )
}
```
TopDownSet Example Data

Description

An example data set for topdownr. It is just a subset of the myoglobin dataset available in topdownr::topdownrdata-package.

Usage

tds

Format

A TopDownSet with 14901 fragments (1949 rows, 351 columns).

Details

It was created as follows:

```r
tds <- readTopDownFiles(
  topdownrdata::topDownDataPath("myoglobin"),
  ## Use an artificial pattern to load just the fasta
  ## file and files from m/z == 1211, ETD reagent
  ## target 1e6 and first replicate to keep runtime
  ## of the example short
  pattern=".*fasta.gz$|1211_.*1e6_1",
  adducts=data.frame(mass=1.008, name="zpH", to="z"),
  neutralLoss=PSMatch::defaultNeutralLoss(
    disableWaterLoss=c("Cterm", "D", "E", "S", "T")),
  tolerance=25e-6)
```

Source

Subset taken from the topdownr::topdownrdata-package package.

deprecated

Description

Deprecated functions in topdownr

These functions are provided for compatibility with older versions of ‘MyPkg’ only, and will be defunct at the next release.
TopDownSet-class

Details

The following functions are deprecated and will be made defunct; use the replacement indicated below:

- defaultMs1Settings: expandMs1Conditions() in combination with createExperimentsFragmentOptimisation()
- defaultMs2Settings: expandTms2Conditions() in combination with createExperimentsFragmentOptimisation()

Description

The TopDownSet class is a container for a whole top-down proteomics experiment.

Usage

```r
## S4 method for signature 'TopDownSet'
aggregate(x, by = x$Sample, ...)

## S4 method for signature 'TopDownSet,TopDownSet'
combine(x, y)

## S4 method for signature 'TopDownSet'
filterCv(object, threshold, by = object$Sample, ...)

## S4 method for signature 'TopDownSet'
filterInjectionTime(
  object,
  maxDeviation = log2(3),
  keepTopN = 2,
  by = object$Sample,
  ...
)

## S4 method for signature 'TopDownSet'
filterIntensity(object, threshold, relative = TRUE, ...)

## S4 method for signature 'TopDownSet'
filterNonReplicatedFragments(object, minN = 2, by = object$Sample, ...)

## S4 method for signature 'TopDownSet'
normalize(object, method = "TIC", ...)

## S4 method for signature 'TopDownSet,missing'
plot(x, y, ..., verbose = interactive())
```
## S4 method for signature 'TopDownSet'
show(object)

## S4 method for signature 'TopDownSet'
summary(object, what = c("conditions", "fragments"), ...)

### Arguments

- **x, object**: `TopDownSet`
- **by**: `list`, grouping variable, in general it refers to technical
- **y**: missing, not used.
- **threshold**: `double`, threshold variable.
- **maxDeviation**: `double`, maximal allowed deviation in the log2 injection time in ms in comparison to the median ion injection time.
- **keepTopN**: `integer`, how many technical replicates should be kept?
- **relative**: `logical`, if relative is `TRUE` all fragments with intensity below `threshold * max(intensity)` per fragment are removed, otherwise all fragments below `threshold` are removed.
- **minN**: `numeric`, if less than `minN` of a fragment are found across technical replicates it is removed.
- **method**: `character`, normalisation method, currently just "TIC" for Total Ion Current normalisation of the scans/conditions (column-wise normalisation) is supported.
- **verbose**: `logical`, verbose output?
- **what**: `character`, specifies whether "conditions" (columns; default) or "fragments" (rows) should be summarized.
- **...**: arguments passed to internal/other methods. replicates (that’s why the default is the "Sample" column in `colData`).

### Details

See vignette("analysis", package="topdownr") for a detailed example how to work with `TopDownSet` objects.

### Value

An `TopDownSet` object.

### Methods (by generic)

- **aggregate(TopDownSet)**: Aggregate conditions/runs.
  
  Aggregates conditions/runs (columns) in an `TopDownSet` object by a user-given value (default is the "Sample" column of `colData` which has the same value for technical replicates). It combines intensity values and numeric metadata of the grouped conditions/runs (columns) by mean and returns a reduced `TopDownSet` object.
• **combine(x = TopDownSet, y = TopDownSet):** Combine TopDownSet objects.
  combine allows to combine two or more TopDownSet objects. Please note that it uses the default sampleColumns to define technical replicates (see `readTopDownFiles()`).and the default by argument to group ion injection times for the calculation of the median time (see `updateMedianInjectionTime()`). Both could be modified after combine by calling `updateConditionNames()` (with modified sampleColumns argument) and `updateMedianInjectionTime()` (with modified by argument).

• **filterCv(TopDownSet):** Filter by CV.
  Filtering is done by coefficient of variation across technical replicates (defined by the by argument). All fragments below a given threshold are removed. The threshold is the maximal allowed CV in percent (sd/mean * 100 < threshold).

• **filterInjectionTime(TopDownSet):** Filter by ion injection time.
  Filtering is done by maximal allowed deviation and just the technical keepTopN replicates with the lowest deviation from the median ion injection time are kept.

• **filterIntensity(TopDownSet):** Filter by intensity.
  Filtering is done by removing all fragments that are below a given (absolute/relative) intensity threshold.

• **filterNonReplicatedFragments(TopDownSet):** Filter by non-replicated fragments.
  Filtering is done by removing all fragments that don’t replicate across technical replicates.

• **normalize(TopDownSet):** Normalise.
  Applies Total Ion Current normalisation to a TopDownSet object. The normalisation is done per scans/conditions (column-wise normalisation).

• **plot(x = TopDownSet, y = missing):** Plotting.
  Plots an TopDownSet object. The function returns a list of ggplot objects (one item per condition). Use pdf or another non-interactive device to plot the list of ggplot objects (see example section).

• **summary(TopDownSet):** Summary statistics.
  Returns a matrix with some statistics: number of fragments, total/min/first quartile/median/mean/third quartile/maximum of intensity values.

### Slots

- **rowViews** `FragmentViews`, information about fragments (name, type, sequence, mass, charge), see `FragmentViews` for details.
- **colData** `S4Vectors::DataFrame`, information about the MS2 experiments and the fragmentation conditions.
- **assay** `Matrix::dgCMatrix`, intensity values of the fragments. The rows correspond to the fragments and the columns to the condition/run. It just stores values that are different from zero.
- **files** character, files that were imported.
- **tolerance** double, tolerance in ppm that were used for matching the experimental mz values to the theoretical fragments.
- **redundantMatching** character, matching strategies for redundant ion/fragment matches. See `redundantIonMatch` and `redundantFragmentMatch` in `readTopDownFiles()` for details.
- **processing** character, log messages.
Coercion

`as(object, "MSnSet")`: Coerce an `TopDownSet` object into an `MSnbase::MSnSet` object.

`as(object, "NCBSet")`: Coerce an `TopDownSet` object into an `NCBSet` object.

# Subsetting

# First 100 fragments
tds[1:100]

# All c fragments
tds["c"]

# Just c 152
tds["c152"]

# Condition 1 to 10
tds[, 1:10]

# Filtering
# Filter all intensities that don't have at least 10 % of the highest
# intensity per fragment.
```
tds <- filterIntensity(tds, threshold=0.1)
# Filter all conditions with a CV above 30 % (across technical replicates)
tds <- filterCv(tds, threshold=30)
# Filter all conditions with a large deviation in injection time
tds <- filterInjectionTime(tds, maxDeviation=log2(3), keepTopN=2)
# Filter all conditions where fragments don’t replicate
tds <- filterNonReplicatedFragments(tds)
# Normalise by TIC
tds <- normalize(tds)
# Aggregate technical replicates
tds <- aggregate(tds)
head(summary(tds))
# Coercion
as(tds, "NCBSet")
if (require("MSnbase")) {
  as(tds, "MSnSet")
}
## Not run:
# plot a single condition
# pseudo-code (replace todownset with your object)
plot(todownset[,1])
# plot the whole object
pdf("topdown-spectra.pdf", paper="a4r", width=12)
# pseudo-code (replace todownset with your object)
plot(todownset)
dev.off()
## End(Not run)

validMs1Settings

**List valid MS settings.**

**Description**

These functions list settings for MS1 or TMS2 that are supported by Thermo’s XmlMethodChanger.

**Usage**

```r
validMs1Settings(family = "Calcium", version = "3.2")
validTms2Settings(
```
writeMethodXmls

    type = c("All", "TMS2", "ETD", "CID", "HCD", "UVPD"),
    family = "Calcium",
    version = "3.2"
)

Arguments

family character, currently just Calcium is supported
version character, currently 3.1, 3.2 (default), 3.3 are supported
type character, type of activation.

Value

matrix with three columns:

- name: element name
- class: expected R class of the value
- type: MS/ActivationType, e.g. MS1/TMS2/ETD/...

Examples

validMs1Settings()
validTms2Settings()
validTms2Settings("TMS2")
validTms2Settings("ETD")
validTms2Settings(c("TMS2", "ETD"))

writeMethodXmls Create Orbitrap Fusion Lumos method.xml files.

Description

This function is used to create Orbitrap Fusion Lumos method files from a tree-like list experiment generated by e.g. createExperimentsFragmentOptimisation().

Usage

writeMethodXmls(exps, pattern = "method-%s.xml", verbose = interactive())

Arguments

exps list, generated by e.g. createExperimentsFragmentOptimisation()
pattern character, file name pattern for the method.xml files.
verbose logical, verbose output?
writeMethodXmls

Details

- **exps**: a named tree-like list object generated by e.g. `createExperimentsFragmentOptimisation()`. Its names are used as filename.
- **pattern**: The file name pattern used to name different method files. It must contain a "%s" that is replaced by the conditions defined in `groupBy`.

**DEFUNCT** options:

- **ms1Settings**: A list of MS1 settings. This has to be a named list. Valid MS1 settings are:
  
c("FirstMass", "LastMass", "Microscans", "MaxITTimeInMS", "AgcTarget")

- **ms2Settings**: A list of MS2 settings. This has to be a named list. Valid MS2 settings are:
  

- **groupBy**: The `groupBy` parameter is used to split methods into different files. Valid entries are all settings that could be used in `ms2Settings` and "replication".

- **massLabeling**: The Orbitrap Fusion devices seems not to respect the start and end times of the runs given in the method.xml files. That’s why it is nearly impossible to identify the run with its conditions based on the timings. If `massLabeling` is TRUE (default) the mass values given in `mz` are rounded to the first decimal place and the second to fourth decimal place is used as numeric identifier.
