| agACCNUM | Map between manufacturer IDs and AGI locus IDs |

Description

agACCNUM is an R object that provide mappings between manufacturer IDs and AGI locus IDs.

Details

Each manufacturer ID is mapped to a vector of AGI locus IDs.
If a manufacturer ID is mapped to multiple AGI locus IDs, then all of these AGI locus IDs will be listed.
For agACCNUM an NA is assigned to those manufacturer IDs that can not be mapped to an AGI locus ID at this time.
Mappings were based on data provided by: Tair https://www.arabidopsis.org/download\_files/Microarrays/Affymetrix/affy\_AG\_array\_elements-2010-12-20.txt With a date stamp from the source of: 2021-Apr15

See Also

- AnnotationDb-class for use of the select() interface.
- nhit.

Examples

```
## select() interface:
## Objects in this package can be accessed using the select() interface
## from the AnnotationDbi package. See ?select for details.

## Bimap interface:
x <- agACCNUM
# Get the probe identifiers that are mapped to a chromosome
mapped_probes <- mappedkeys(x)
# Convert to a list
xx <- as.list(x[mapped_probes])
```
if(length(xx) > 0) {
    # Get the AGI locus IDs for the first five probes
    xx[1:5]
    # Get the first one
    xx[[1]]
}

## y <- agMULTIHIT
## identical(keys(x), keys(y))  # TRUE

# nhx <- nhit(x)
# nhy <- nhit(y)
# identical(names(nhx), keys(x))  # TRUE
# identical(names(nhy), keys(y))  # TRUE
# table(nhx)
# table(nhy)
# onehit_probes <- names(nhx)[nhx != 0 & nhy == 0]
# x[[onehit_probes[1]]]  # a single AGI locus ID
# y[[onehit_probes[1]]]  # NA
# multihit_probes <- names(nhx)[nhy != 0]
# x[[multihit_probes[1]]]  # "multiple"
# y[[multihit_probes[1]]]  # several AGI locus IDs
# nohit_probes <- names(nhx)[nhx == 0]
# x[[nohit_probes[1]]]  # NA
# y[[nohit_probes[1]]]  # NA
# any(nhx == 0 & nhy != 0)  # FALSE
## Back to a more "normal" map (that combines the data from 'x' and 'y')
# xy <- as(x, "AnnDbBimap")  # 'as(y, "AnnDbBimap")' works too
# xy[[onehit_probes[1]]]  # a single AGI locus ID
# xy[[multihit_probes[1]]]  # several AGI locus IDs
# xy[[nohit_probes[1]]]  # NA

---

### agARACYC

**Mappings between probe identifiers and KEGG pathway identifiers**

---

**Description**

AraCyc [http://www.arabidopsis.org/tools/aracyc/](http://www.arabidopsis.org/tools/aracyc/) maintains pathway data for Arabidopsis thaliana. agARACYC maps probe identifiers to the common names of the pathways in which the genes represented by the probe identifiers are involved. Information is obtained from AraCyc.

**Details**

With a date stamp from the source of: 2021-Apr15

**References**

## select() interface:
## Objects in this package can be accessed using the `select()` interface
## from the `AnnotationDbi` package. See `?select` for details.

## Bimap interface:
x <- agARACYC
# Get the probe identifiers that are mapped to pathways
mapped_probes <- mappedkeys(x)
# Convert to a list
xx <- as.list(x[mapped_probes])
if(length(xx) > 0) {
  # Get the pathways for the first five probes
  xx[1:5]
  # For the first probe
  xx[[1]]
}
```

agARACYCENZYME  
Map between Manufacturer IDs and Enzyme Names from ARACYC

Description

agARACYCENZYME is an R object that provides mappings between manufacturer identifiers and Enzyme Names from ARACYC.

Details

Each manufacturer identifier maps to a named vector containing the Enzyme name for that gene according to the ARACYC database. If this information is unknown, the vector will contain an NA.

Mappings between probe identifiers and enzyme identifiers were obtained using files provided by: Tair ftp://ftp.plantcyc.org/Pathways/Data_dumps/PMN15_January2021/pathways/ara_pathways.20210325.txt With a date stamp from the source of: 2021-Apr15

- `AnnotationDb-class` for use of the `select()` interface.

Examples

```r
## select() interface:
## Objects in this package can be accessed using the `select()` interface
## from the `AnnotationDbi` package. See `?select` for details.
```
## Bimap interface:

```r
x <- agARACYCENZYME
# Get the probe identifiers that are mapped to an Enzyme Name
mapped_probes <- mappedkeys(x)
# Convert to a list
xx <- as.list(x[mapped_probes])
if(length(xx) > 0) {
  # Get the ENZYME name for the first five probes
  xx[1:5]
  # Get the first one
  xx[[1]]
}
```

---

**ag.db**  
**Bioconductor annotation data package**

**Description**

Welcome to the ag.db annotation Package. The purpose of this package is to provide detailed information about the ag platform. This package is updated biannually.

Objects in this package are accessed using the `select()` interface. See `?select` in the AnnotationDbi package for details.

**See Also**

- `AnnotationDb-class` for use of `keys()`, `columns()` and `select()`.

**Examples**

```r
## select() interface:
## Objects in this package can be accessed using the select() interface
## from the AnnotationDbi package. See `?select` for details.
columns(ag.db)

## Bimap interface:
## The 'old style' of interacting with these objects is manipulation as
## bimaps. While this approach is still available we strongly encourage the
## use of select().
ls("package:ag.db")
```
Description

agCHR is an R object that provides mappings between a manufacturer identifier and the chromosome that contains the gene of interest.

Details

Each manufacturer identifier maps to a vector of chromosomes. Due to inconsistencies that may exist at the time the object was built, the vector may contain more than one chromosome (e.g., the identifier may map to more than one chromosome). If the chromosomal location is unknown, the vector will contain an NA.

Mappings were based on data provided by: Tair https://www.arabidopsis.org/download\_files/Genes/TAIR10\_genome\_release/TAIR10\_functional\_descriptions
With a date stamp from the source of: 2021-Apr15

See Also

- AnnotationDb-class for use of the select() interface.

Examples

```r
## select() interface:
## Objects in this package can be accessed using the select() interface
## from the AnnotationDbi package. See ?select for details.

## Bimap interface:
x <- agCHR
# Get the probe identifiers that are mapped to a chromosome
mapped_probes <- mappedkeys(x)
# Convert to a list
xx <- as.list(x[mapped_probes])
if(length(xx) > 0) {
  # Get the CHR for the first five probes
  xx[1:5]
  # Get the first one
  xx[[1]]
}
```
agCHRLENGTHS  

A named vector for the length of each of the chromosomes

Description

agCHRLENGTHS provides the length measured in base pairs for each of the chromosomes.

Details

This is a named vector with chromosome numbers as the names and the corresponding lengths for chromosomes as the values.

Total lengths of chromosomes were derived by calculating the number of base pairs on the sequence string for each chromosome.

See Also

• AnnotationDb-class for use of the select() interface.

Examples

## select() interface:
## Objects in this package can be accessed using the select() interface
## from the AnnotationDbi package. See ?select for details.

## Bimap interface:
tt <- agCHRLENGTHS
# Length of chromosome 1
tt["1"]

agCHRLOC  

Map Manufacturer IDs to Chromosomal Location

Description

agCHRLOC is an R object that maps manufacturer identifiers to the starting position of the gene. The position of a gene is measured as the number of base pairs.

The CHRLOCEND mapping is the same as the CHRLOC mapping except that it specifies the ending base of a gene instead of the start.
Details

Each manufacturer identifier maps to a named vector of chromosomal locations, where the name indicates the chromosome. Due to inconsistencies that may exist at the time the object was built, these vectors may contain more than one chromosome and/or location. If the chromosomal location is unknown, the vector will contain an NA.

Chromosomal locations on both the sense and antisense strands are measured as the number of base pairs from the p (5' end of the sense strand) to q (3' end of the sense strand) arms. Chromosomal locations on the antisense strand have a leading "-" sign (e. g. -1234567).

Mappings were based on data provided by: Tair https://www.arabidopsis.org/download\_files/Maps/seqviewer\_data/sv\_gene.data With a date stamp from the source of: 2021-Apr15

## from the AnnotationDbi package. See ?select for details.

## Bimap interface:
> x <- agCHRLOC
> mapped_probes <- mappedkeys(x)
> xx <- as.list(x[mapped_probes])
> if(length(xx) > 0) {
>   # Get the CHRLOC for the first five probes
>   xx[1:5]
>   # Get the first one
>   xx[[1]]
> }
```
Details

Each manufacturer identifier maps to a named vector containing the EC number that corresponds to the enzyme produced by that gene. The name corresponds to the manufacturer identifier. If this information is unknown, the vector will contain an NA.

Enzyme Commission numbers are assigned by the Nomenclature Committee of the International Union of Biochemistry and Molecular Biology [http://www.chem.qmw.ac.uk/iubmb/enzyme/] to allow enzymes to be identified.

An Enzyme Commission number is of the format EC x.y.z.w, where x, y, z, and w are numeric numbers. In agENZYME2PROBE, EC is dropped from the Enzyme Commission numbers.

Enzyme Commission numbers have corresponding names that describe the functions of enzymes in such a way that EC x is a more general description than EC x.y that in turn is a more general description than EC x.y.z. The top level EC numbers and names are listed below:

- EC 1 oxidoreductases
- EC 2 transferases
- EC 3 hydrolases
- EC 4 lyases
- EC 5 isomerases
- EC 6 ligases

The EC name for a given EC number can be viewed at [http://www.chem.qmul.ac.uk/iupac/jcbn/index.html#6](http://www.chem.qmul.ac.uk/iupac/jcbn/index.html#6)

Mappings between probe identifiers and enzyme identifiers were obtained using files provided by:
With a date stamp from the source of: 2021-Apr15

x <- agENZYME
# Get the probe identifiers that are mapped to an EC number
mapped_probes <- mappedkeys(x)
# Convert to a list
xx <- as.list(x[mapped_probes])
if(length(xx) > 0) {
  # Get the ENZYME for the first five probes
```

agENZYME2PROBE

Map between Enzyme Commission Numbers and Manufacturer Identifiers

Description

agENZYME2PROBE is an R object that maps Enzyme Commission (EC) numbers to manufacturer identifiers.

Details

Each EC number maps to a named vector containing all of the manufacturer identifiers that correspond to the gene that produces that enzyme. The name of the vector corresponds to the EC number.

Enzyme Commission numbers are assigned by the Nomenclature Committee of the International Union of Biochemistry and Molecular Biology [http://www.chem.qmw.ac.uk/iubmb/enzyme/] to allow enzymes to be identified.

An Enzyme Commission number is of the format EC x.y.z.w, where x, y, z, and w are numeric numbers. In agENZYME2PROBE, EC is dropped from the Enzyme Commission numbers.

Enzyme Commission numbers have corresponding names that describe the functions of enzymes in such a way that EC x is a more general description than EC x.y that in turn is a more general description than EC x.y.z. The top level EC numbers and names are listed below:

EC 1 oxidoreductases
EC 2 transferases
EC 3 hydrolases
EC 4 lyases
EC 5 isomerases
EC 6 ligases

The EC name for a given EC number can be viewed at [http://www.chem.qmul.ac.uk/iupac/jcfn/index.html#6](http://www.chem.qmul.ac.uk/iupac/jcfn/index.html#6)

Mappings were based on data provided by: Tair ftp://ftp.plantcyc.org/Pathways/Data\_dumps/PMN15\_January2021/pathways

agGENENAME

Map between Manufacturer IDs and Genes

Description

agGENENAME is an R object that maps manufacturer identifiers to the corresponding gene name.

Details

Each manufacturer identifier maps to a named vector containing the gene name. The vector name corresponds to the manufacturer identifier. If the gene name is unknown, the vector will contain an NA.

Gene names currently include both the official (validated by a nomenclature committee) and preferred names (interim selected for display) for genes. Efforts are being made to differentiate the two by adding a name to the vector.

Mappings were based on data provided by: Tair https://www.arabidopsis.org/download\_files/Genes/TAIR10\_genome\_release With a date stamp from the source of: 2021-Apr15

## from the AnnotationDbi package. See ?select for details.

## Bimap interface:
x <- agGENENAME
# Get the probe identifiers that are mapped to a gene name
mapped_probes <- mappedkeys(x)
```
agGO

Description

agGO is an R object that provides mappings between manufacturer identifiers and the GO identifiers that they are directly associated with.

Details

Each Entrez Gene identifier is mapped to a list of lists. The names on the outer list are GO identifiers. Each inner list consists of three named elements: GOID, Ontology, and Evidence.

The GOID element matches the GO identifier named in the outer list and is included for convenience when processing the data using 'lapply'.

The Ontology element indicates which of the three Gene Ontology categories this identifier belongs to. The categories are biological process (BP), cellular component (CC), and molecular function (MF).

The Evidence element contains a code indicating what kind of evidence supports the association of the GO identifier to the Entrez Gene id. Some of the evidence codes in use include:

- IMP: inferred from mutant phenotype
- IGI: inferred from genetic interaction
- IPI: inferred from physical interaction
- ISS: inferred from sequence similarity
- IDA: inferred from direct assay
- IEP: inferred from expression pattern
- IEA: inferred from electronic annotation
- TAS: traceable author statement
- NAS: non-traceable author statement
- ND: no biological data available
- IC: inferred by curator

A more complete listing of evidence codes can be found at:

Mappings between probe identifiers and GO information were obtained through their mappings to Entrez Gene identifiers. NAs are assigned to probe identifiers that can not be mapped to any Gene Ontology information. Mappings between Gene Ontology identifiers and Gene Ontology terms and other information are available in a separate data package named GO.

Mappings were based on data provided by: Gene Ontology http://current.geneontology.org/ontology/go-basic.obo With a date stamp from the source of: 2021-02-01

## select() interface:
## Objects in this package can be accessed using the select() interface
## from the AnnotationDbi package. See ?select for details.

## Bimap interface:
x <- agGO
# Get the probe identifiers that are mapped to a GO ID
mapped_probes <- mappedkeys(x)
# Convert to a list
xx <- as.list(x[mapped_probes])
if(length(xx) > 0) {
  # Try the first one
  got <- xx[[1]]
  got[[1]]["GOID"]
  got[[1]]["Ontology"]
  got[[1]]["Evidence"]
}
```

---

**agGO2ALLPROBES**

*Map between Gene Ontology (GO) Identifiers and all Manufacturer Identifiers in the subtree*

**Description**

agGO2ALLPROBES is an R object that provides mappings between a given GO identifier and all manufacturer identifiers annotated at that GO term or one of its children in the GO ontology.

**Details**

GO consists of three ontologies—molecular function (MF), biological process (BP), and cellular component (CC). All ontologies are structured as directed acyclic graphs (DAGs). Each node in each DAG (tree) is a GO term (id) associated with a named vector of manufacturer identifiers. The name associated with each manufacturer id corresponds to the evidence code for that GO identifier. This object agGO2ALLPROBES maps between a given GO identifier and all manufacturer identifiers annotated at that GO term or one of its children in the GO ontology.
The evidence code indicates what kind of evidence supports the association between the GO and Entrez Gene identifiers. Evidence codes currently in use include:

- IMP - inferred from mutant phenotype
- IGI - inferred from genetic interaction
- IPI - inferred from physical interaction
- ISS - inferred from sequence similarity
- IDA - inferred from direct assay
- IEP - inferred from expression pattern
- IEA - inferred from electronic annotation
- TAS - traceable author statement
- NAS - non-traceable author statement
- ND - no biological data available
- IC - inferred by curator

A GO identifier may be mapped to the same manufacturer identifier more than once but the evidence code can be different. Mappings between Gene Ontology identifiers and Gene Ontology terms and other information are available in a separate data package named GO.

Mappings were based on data provided by:

Gene Ontology http://current.geneontology.org/ontology/go-basic.obo With a date stamp from the source of: 2021-02-01

  # Gets all the probe identifiers for the first element of goids
goids[[1]]
  # Evidence code for the mappings
  names(goids[[1]])
}
```
**agGO2PROBE**

**Map between Gene Ontology (GO) and Manufacturer Identifiers**

### Description

agGO2PROBE is an R object that provides mappings between GO identifiers and manufacturer identifiers.

### Details

Each GO term maps to a named vector of manufacturer identifiers. The name associated with each manufacturer identifier corresponds to the evidence code for that GO identifier. The evidence code indicates what kind of evidence supports the association between the GO and Entrez Gene identifiers. Evidence codes currently in use include:

- IMP - inferred from mutant phenotype
- IGI - inferred from genetic interaction
- IPI - inferred from physical interaction
- ISS - inferred from sequence similarity
- IDA - inferred from direct assay
- IEP - inferred from expression pattern
- IEA - inferred from electronic annotation
- TAS - traceable author statement
- NAS - non-traceable author statement
- ND - no biological data available
- IC - inferred by curator

A GO identifier may be mapped to the same probe identifier more than once but the evidence code can be different. Mappings between Gene Ontology identifiers and Gene Ontology terms and other information are available in a separate data package named GO.

Mappings were based on data provided by:

Gene Ontology http://current.geneontology.org/ontology/go-basic.obo With a date stamp from the source of: 2021-02-01

  # Evidence code for the mappings
  names(goids[[1]])
}

agMAPCOUNTS

**Number of mapped keys for the maps in package ag.db**

Description

DEPRECATED. Counts in the MAPCOUNT table are out of sync and should not be used.

agMAPCOUNTS provides the "map count" (i.e. the count of mapped keys) for each map in package ag.db.

Details

DEPRECATED. Counts in the MAPCOUNT table are out of sync and should not be used.

This "map count" information is precalculated and stored in the package annotation DB. This allows some quality control and is used by the checkMAPCOUNTS function defined in AnnotationDbi to compare and validate different methods (like count.mappedkeys(x) or sum(!is.na(as.list(x)))) for getting the "map count" of a given map.

agORGANISM

**The Organism information for ag**

Description

agORGANISM is an R object that contains a single item: a character string that names the organism for which ag was built. agORGPKG is an R object that contains a character vector with the name of the organism package that a chip package depends on for its gene-centric annotation.
Details

Although the package name is suggestive of the organism for which it was built, agORGANISM provides a simple way to programmatically extract the organism name. agORGPKG provides a simple way to programmatically extract the name of the parent organism package. The parent organism package is a strict dependency for chip packages as this is where the gene-centric information is ultimately extracted from. The full package name will always be this string plus the extension ".db". But most programatic access will not require this extension, so it's more convenient to leave it out.

Examples

    agORGANISM
    agORGPKG

---

**agPATH**

*Mappings between probe identifiers and KEGG pathway identifiers*

Description

KEGG (Kyoto Encyclopedia of Genes and Genomes) maintains pathway data for various organisms. agPATH maps probe identifiers to the identifiers used by KEGG for pathways in which the genes represented by the probe identifiers are involved.

Details

Each KEGG pathway has a name and identifier. Pathway name for a given pathway identifier can be obtained using the KEGG data package that can either be built using AnnBuilder or downloaded from Bioconductor [http://www.bioconductor.org](http://www.bioconductor.org).

## from the AnnotationDbi package. See ?select for details.

## Bimap interface:
x <- agPATH
# Get the probe identifiers that are mapped to a KEGG pathway ID
mapped_probes <- mappedkeys(x)
# Convert to a list
xx <- as.list(x[mapped_probes])
if(length(xx) > 0) {
  # Get the PATH for the first five probes
  xx[1:5]
  # Get the first one
  xx[[1]]
}
```

agPATH2PROBE

Map between Kyoto Encyclopedia of Genes and Genomes (KEGG) pathway identifiers and Manufacturer Identifiers

Description

agPATH2PROBE is an R object that provides mappings between KEGG identifiers and manufacturer identifiers.

Details

Each KEGG identifier is mapped to a named vector of manufacturer identifiers. The name represents the KEGG identifier and the vector contains all manufacturer identifiers that are found in that particular pathway. An NA is reported for any KEGG identifier that cannot be mapped to any manufacturer identifiers.

Pathway name for a given pathway identifier can be obtained using the KEGG data package that can either be built using AnnBuilder or downloaded from Bioconductor [http://www.bioconductor.org](http://www.bioconductor.org).

Mappings were based on data provided by: KEGG GENOME ftp://ftp.genome.jp/pub/kegg/GENOME
With a date stamp from the source of: 2011-Mar15

xx <- as.list(agPATH2PROBE)
# Remove pathway identifiers that do not map to any probe id
xx <- xx[!is.na(xx)]
if(length(xx) > 0){
  # The probe identifiers for the first two elements of XX
  xx[1:2]
  # Get the first one
  xx[[1]]
}
```

agPMID

Map between Manufacturer Identifiers and PubMed Identifiers

Description

agPMID is an R object that provides mappings between manufacturer identifiers and PubMed identifiers.

Details

Each manufacturer identifier is mapped to a named vector of PubMed identifiers. The name associated with each vector corresponds to the manufacturer identifier. The length of the vector may be one or greater, depending on how many PubMed identifiers a given manufacturer identifier is mapped to. An NA is reported for any manufacturer identifier that cannot be mapped to a PubMed identifier.

Titles, abstracts, and possibly full texts of articles can be obtained from PubMed by providing a valid PubMed identifier. The pubmed function of annotate can also be used for the same purpose.

Mappings were based on data provided by: Tair https://www.arabidopsis.org/download\_files/Public\_Data\_Releases/TAIR\_Data\_20200331/Locus\_Published\_20200331.txt.gz
With a date stamp from the source of: 2021-Apr15

**agPMID2PROBE**

*Map between PubMed Identifiers and Manufacturer Identifiers*

### Description

`agPMID2PROBE` is an R object that provides mappings between PubMed identifiers and manufacturer identifiers.

### Details

Each PubMed identifier is mapped to a named vector of manufacturer identifiers. The name represents the PubMed identifier and the vector contains all manufacturer identifiers that are represented by that PubMed identifier. The length of the vector may be one or longer, depending on how many manufacturer identifiers are mapped to a given PubMed identifier.

Titles, abstracts, and possibly full texts of articles can be obtained from PubMed by providing a valid PubMed identifier. The `pubmed` function of `annotate` can also be used for the same purpose.

Mappings were based on data provided by: TAIR [https://www.arabidopsis.org/download_files/Public\_Data\_Releases/TAIR\_Data\_20200331/Locus\_Published\_20200331.txt.gz](https://www.arabidopsis.org/download_files/Public\_Data\_Releases/TAIR\_Data\_20200331/Locus\_Published\_20200331.txt.gz) with a date stamp from the source of: 2021-Apr15

    xmls <- pubmed(names(xx)[1], disp = "data")
    # Views article information using a browser
    pubmed(names(xx)[1], disp = "browser")
  }
}

agSYMBOL

Map between Manufacturer Identifiers and Gene Symbols

Description

agSYMBOL is an R object that provides mappings between manufacturer identifiers and gene abbreviations.

Details

Each manufacturer identifier is mapped to an abbreviation for the corresponding gene. An NA is reported if there is no known abbreviation for a given gene.

Symbols typically consist of 3 letters that define either a single gene (ABC) or multiple genes (ABC1, ABC2, ABC3). Gene symbols can be used as key words to query public databases such as Entrez Gene.

Mappings were based on data provided by: Tair https://www.arabidopsis.org/download\_files/Public\_Data\_Releases/TAIR\_Data\_20200331/gene\_aliases\_20200331.txt.gz With a date stamp from the source of: 2021-Apr15

ag_dbconn

Collect information about the package annotation DB

Description

Some convenience functions for getting a connection object to (or collecting information about) the package annotation DB.

Usage

```r
ag_dbconn()
ag_dbfile()
ag_dbschema(file='', show.indices=FALSE)
ag_dbInfo()
```

Arguments

- **file**: A connection, or a character string naming the file to print to (see the `file` argument of the `cat` function for the details).
- **show.indices**: The CREATE INDEX statements are not shown by default. Use `show.indices=TRUE` to get them.

Details

- `ag_dbconn` returns a connection object to the package annotation DB. IMPORTANT: Don’t call `dbDisconnect` on the connection object returned by `ag_dbconn` or you will break all the `AnnDbObj` objects defined in this package!
- `ag_dbfile` returns the path (character string) to the package annotation DB (this is an SQLite file).
- `ag_dbschema` prints the schema definition of the package annotation DB.
- `ag_dbInfo` prints other information about the package annotation DB.
**Value**

ag_dbconn: a DBIConnection object representing an open connection to the package annotation DB.

ag_dbfile: a character string with the path to the package annotation DB.

ag_dbschema: none (invisible NULL).

ag_dbInfo: none (invisible NULL).

**See Also**

dbGetQuery, dbConnect, dbconn, dbfile, dbschema, dbInfo

**Examples**

```r
library(DBI)
## Count the number of rows in the "probes" table:
dbGetQuery(ag_dbconn(), "SELECT COUNT(*) FROM probes")

ag_dbschema()

ag_dbInfo()
```
