Package ‘GIGSEAd ata’

March 28, 2024

Type Package
Title Gene set collections for the GIGSEA package
Version 1.20.0
Author Shijia Zhu
Maintainer Shijia Zhu <shijia.zhu@mssm.edu>
Description The gene set collection used for the GIGSEA package.
License LGPL-3
Encoding UTF-8
LazyData true
Depends R (>= 3.5)
Suggests GIGSEA, knitr, rmarkdown
VignetteBuilder knitr
RoxygenNote 6.0.1
NeedsCompilation no
biocViews ExperimentData, Homo_sapiens_Data
git_url https://git.bioconductor.org/packages/GIGSEAd ata
git_branch RELEASE_3_18
git_last_commit bd836c5
git_last_commit_date 2023-10-24
Repository Bioconductor 3.18
Date/Publication 2024-03-28

R topics documented:

Fantom5.TF .......................................................... 2
org.Hs.eg.GO ................................................... 2

Index 3
Description

The human transcript promoter locations were obtained from Fantom5. Based on the promoter locations, the tool MotEvo was used to predict the human transcriptional factor (TF) target sites.

Usage

Fantom5.TF

Format

A list with two items:

- net  a sparse matrix, the connectivity between terms and genes, comprising 500 Positional Weight Matrices (PWM) and 21964 genes
- annot a data frame, description of terms ...

Source

http://www.swissregulon.unibas.ch

Description

Gene sets that contain genes annotated by the same Gene Ontology (GO) term. For each GO term, we not only incorporate its own gene sets, but also incorporate the gene sets belonging to its offsprings.

Usage

org.Hs.eG.GO

Format

A list with two items:

- net  a sparse matrix, the connectivity between terms and genes
- annot a data frame, description of terms ...
